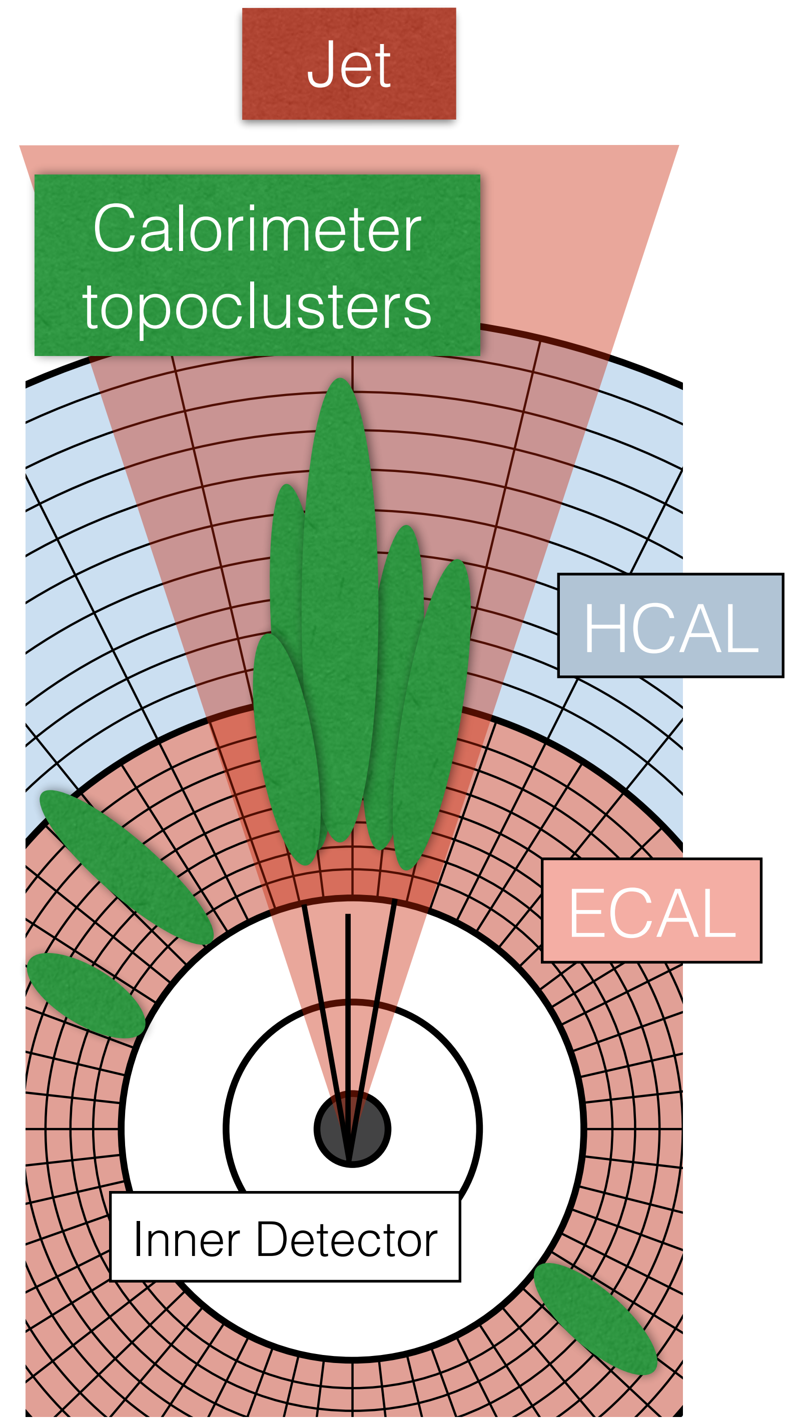
The ATLAS jet reconstruction

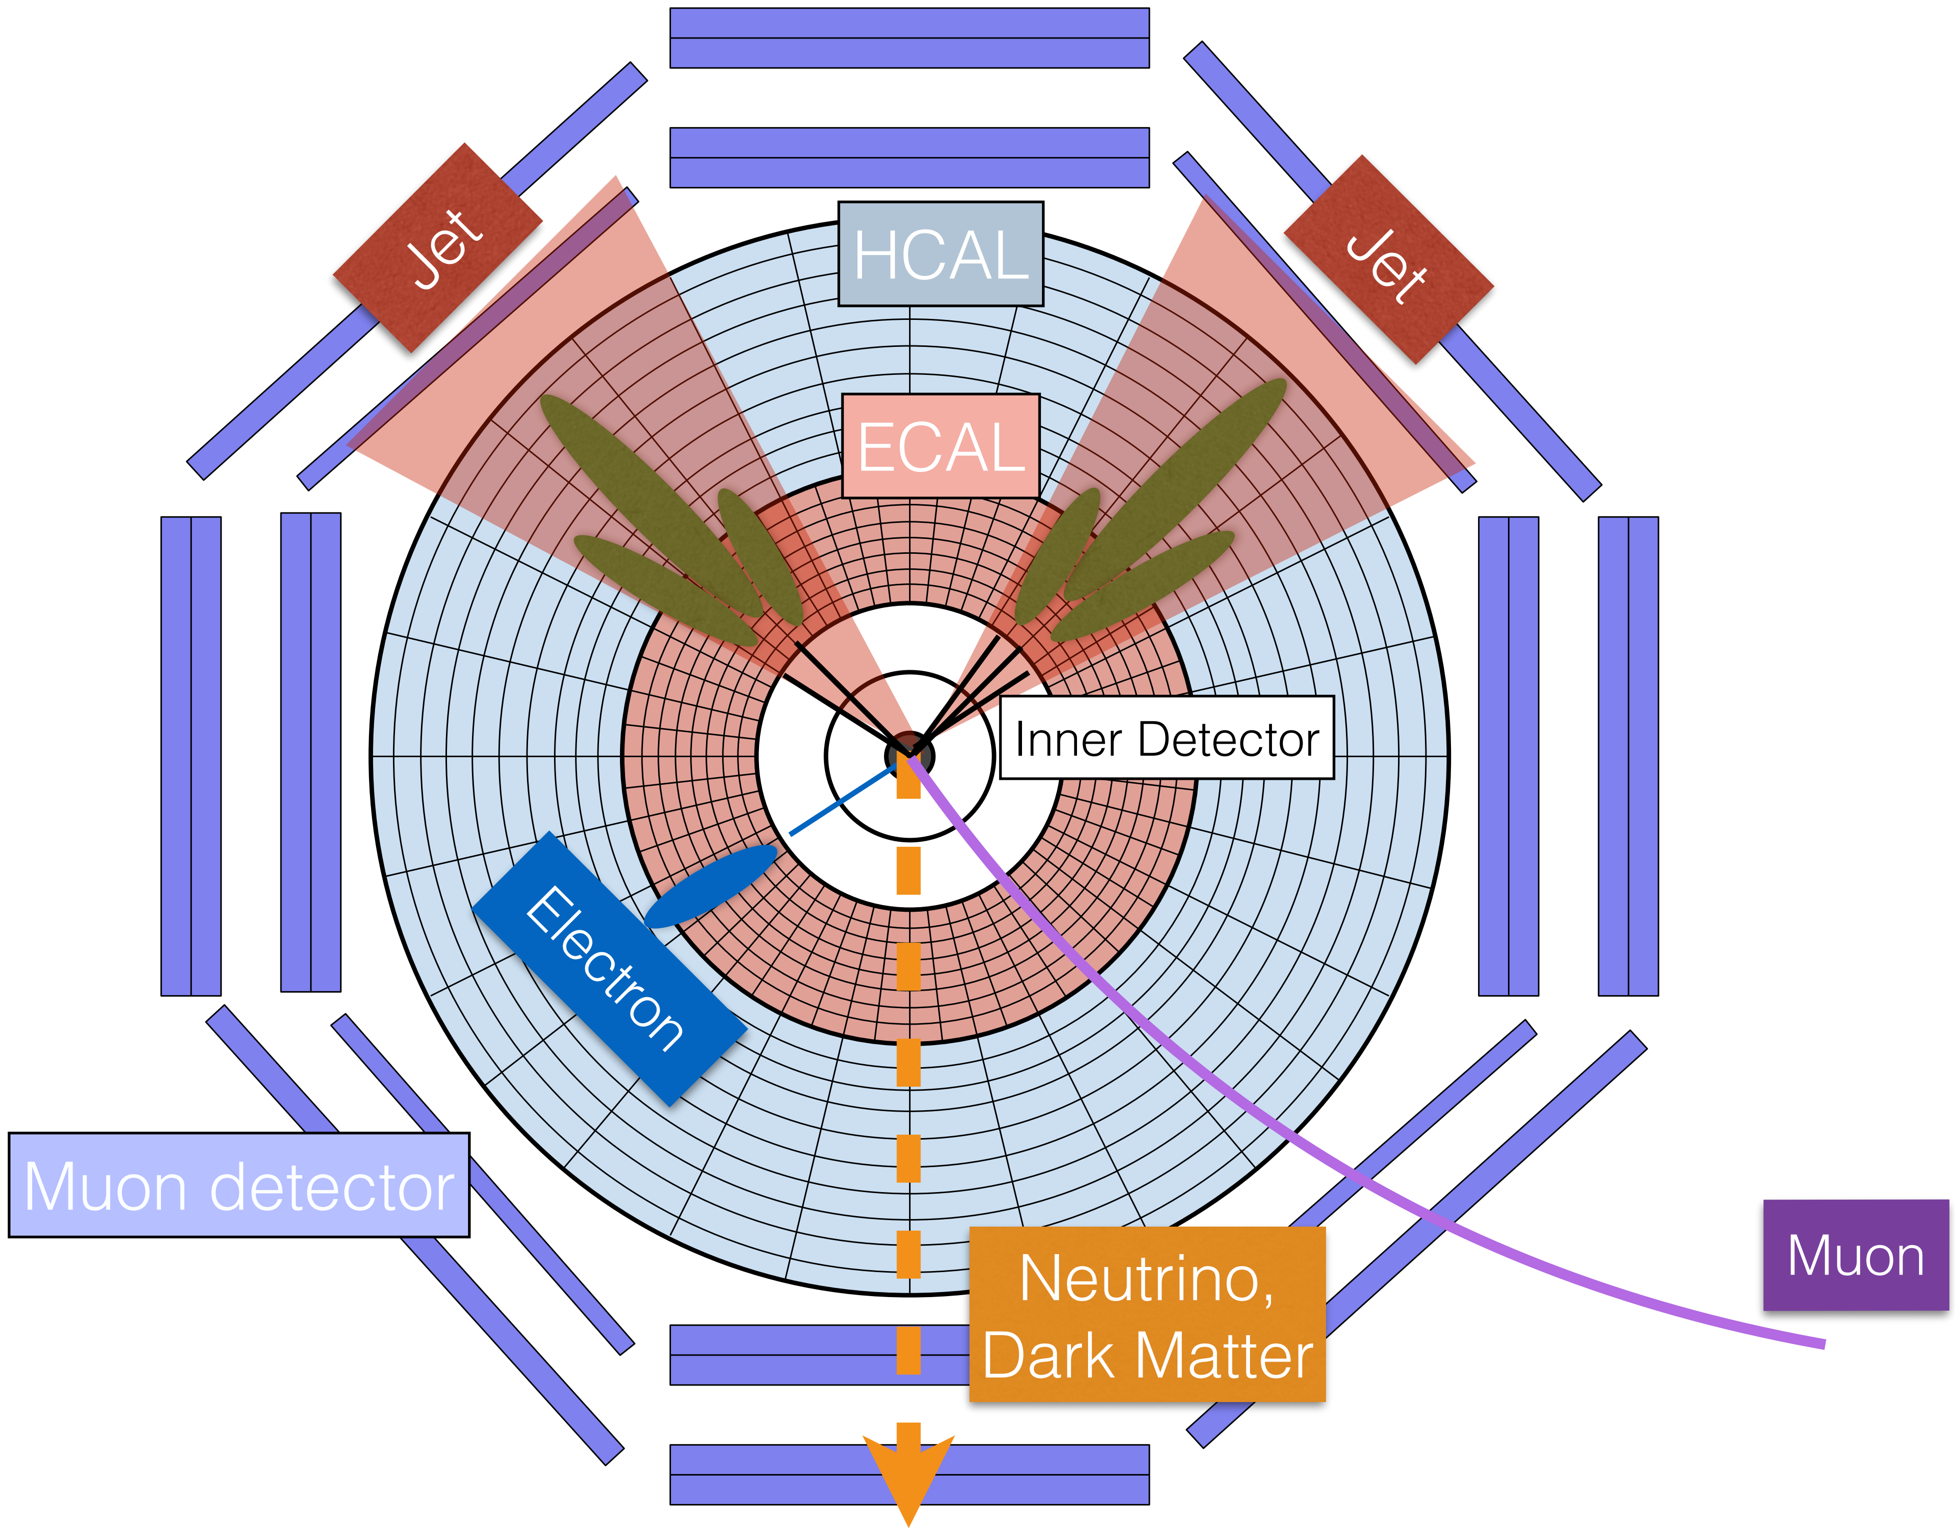
A quick reminder...

- Jets: main observable for quarks and gluons.
- ATLAS jet finding algorithm:
    1. **Clustering** of local energy deposits in the calorimeter (420 topoclusters).
    2. Run **jet finding** on clusters with recombination algorithm (anti-kt).
    3. **Calibrations** to account for dead materials and calorimeter effects.
    4. **Track-based pileup suppression** (JVT).
- **Pure calorimeter-based jet finding approach!**



Marco Valente
Université de Genève

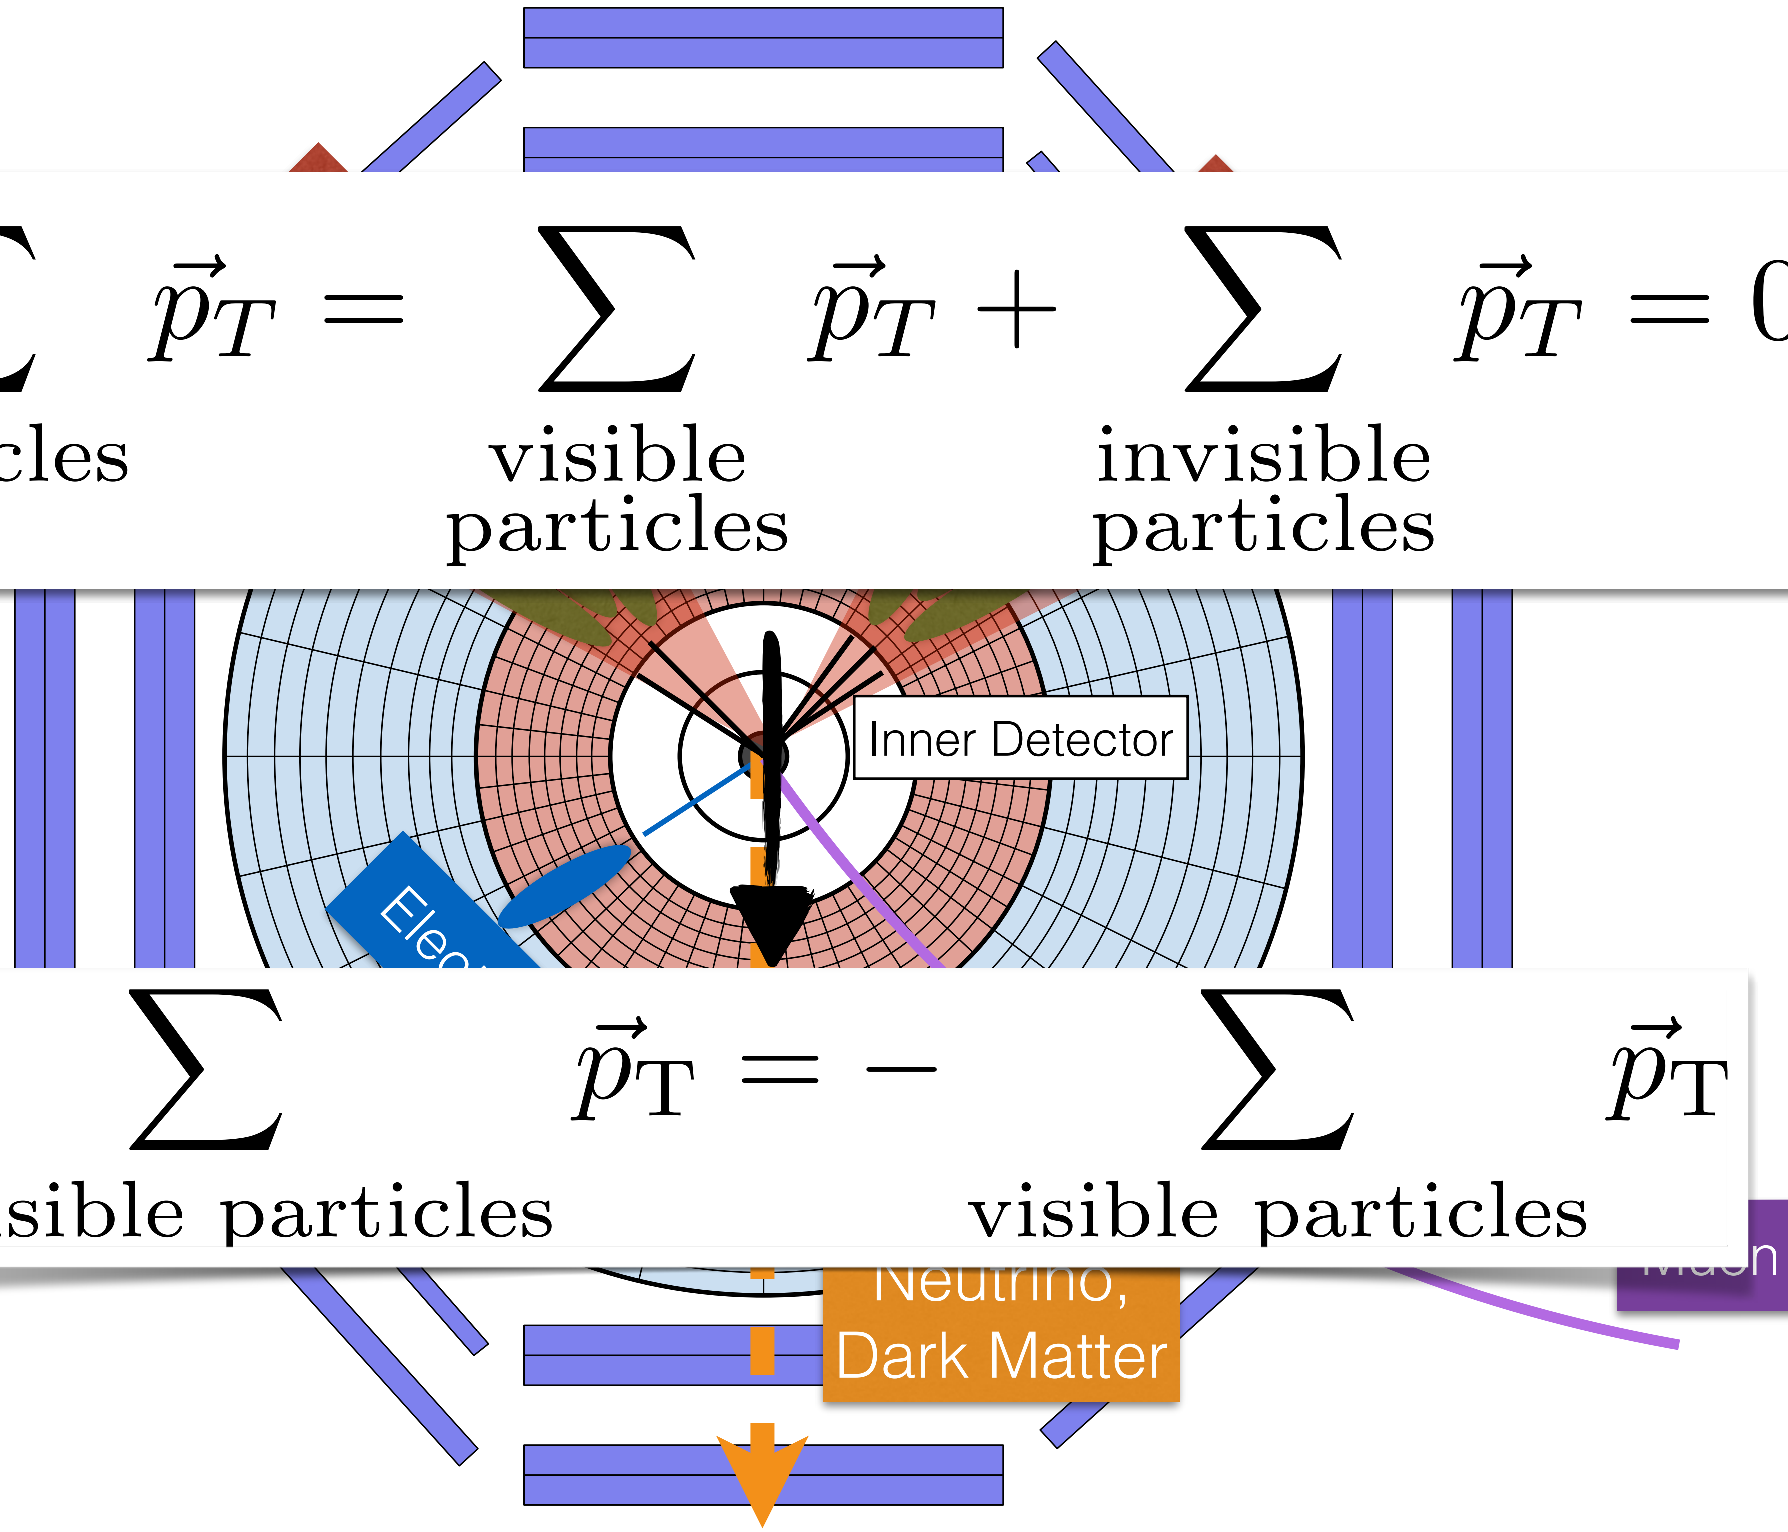
How to see invisible particles?



Conservation of transverse momentum!

How to see invisible particles?

$$\sum_{\text{particles}} \vec{p}_T = \sum_{\substack{\text{visible} \\ \text{particles}}} \vec{p}_T + \sum_{\substack{\text{invisible} \\ \text{particles}}} \vec{p}_T = 0$$



$$\sum_{\text{invisible particles}} \vec{p}_\mathrm{T} = - \sum_{\text{visible particles}} \vec{p}_\mathrm{T}$$

Conservation of transverse momentum!

Marco Valente
Université de Genève

Missing Transverse Momentum (MET)

Observing the invisible

$$E_{\mathrm{T}}^{\mathrm{miss}} = -\Bigg(\underbrace{\sum_{i\,\in\mathrm{muons}} \boldsymbol{p}_{\mathrm{T},i} + \sum_{i\,\in\mathrm{electrons}} \boldsymbol{p}_{\mathrm{T},i} + \sum_{i\,\in\mathrm{photons}} \boldsymbol{p}_{\mathrm{T},i} + \sum_{i\,\in\mathrm{hadronic}\ \tau} \boldsymbol{p}_{\mathrm{T},i} + \sum_{i\,\in\mathrm{jets}} \boldsymbol{p}_{\mathrm{T},i}}_{\text{hard term}} + \underbrace{\sum_{i\,\in\mathrm{Soft\ Term}} \boldsymbol{p}_{\mathrm{T},i}}_{\text{soft term}}\Bigg)$$

All well identified and calibrated physics objects.

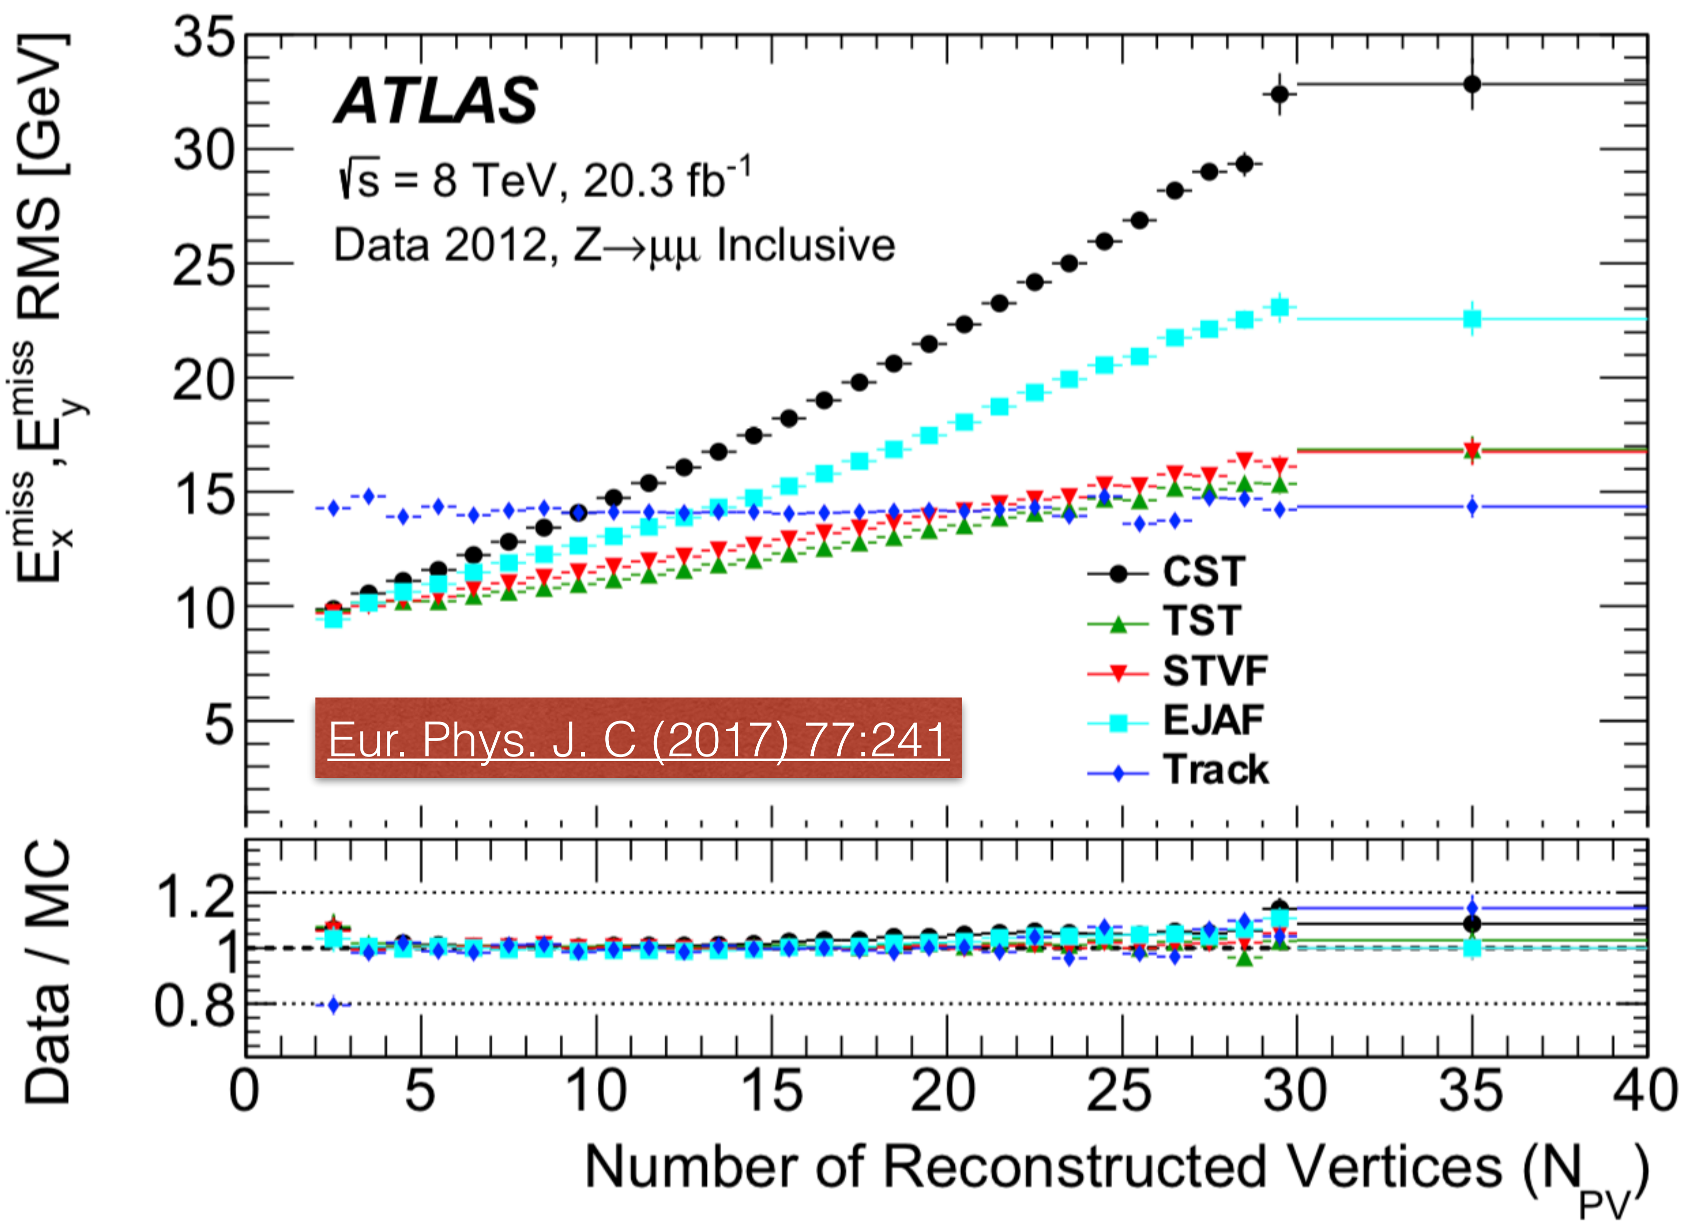
All particles not associated to any physics object

- Historically, two ways of reconstructing the MET soft term:
  - **Calorimeter-based Soft Term (CST):** all calorimeter clusters not associated to any hard object
  - **Track-based Soft Term (TST)**: all tracks not associated to any hard object

Calorimeter based Soft Term (CST)	Track based Soft Term (TST)
1. <u>**Large**</u> dependency by pile-up. 2. Natural inclusion of the neutral soft term component.	1. <u>**Small**</u> dependency by pile-up. 2. Missing neutral particles.

How to reconstruct invisible particles?

Track-based Soft Term performs way better than CST!



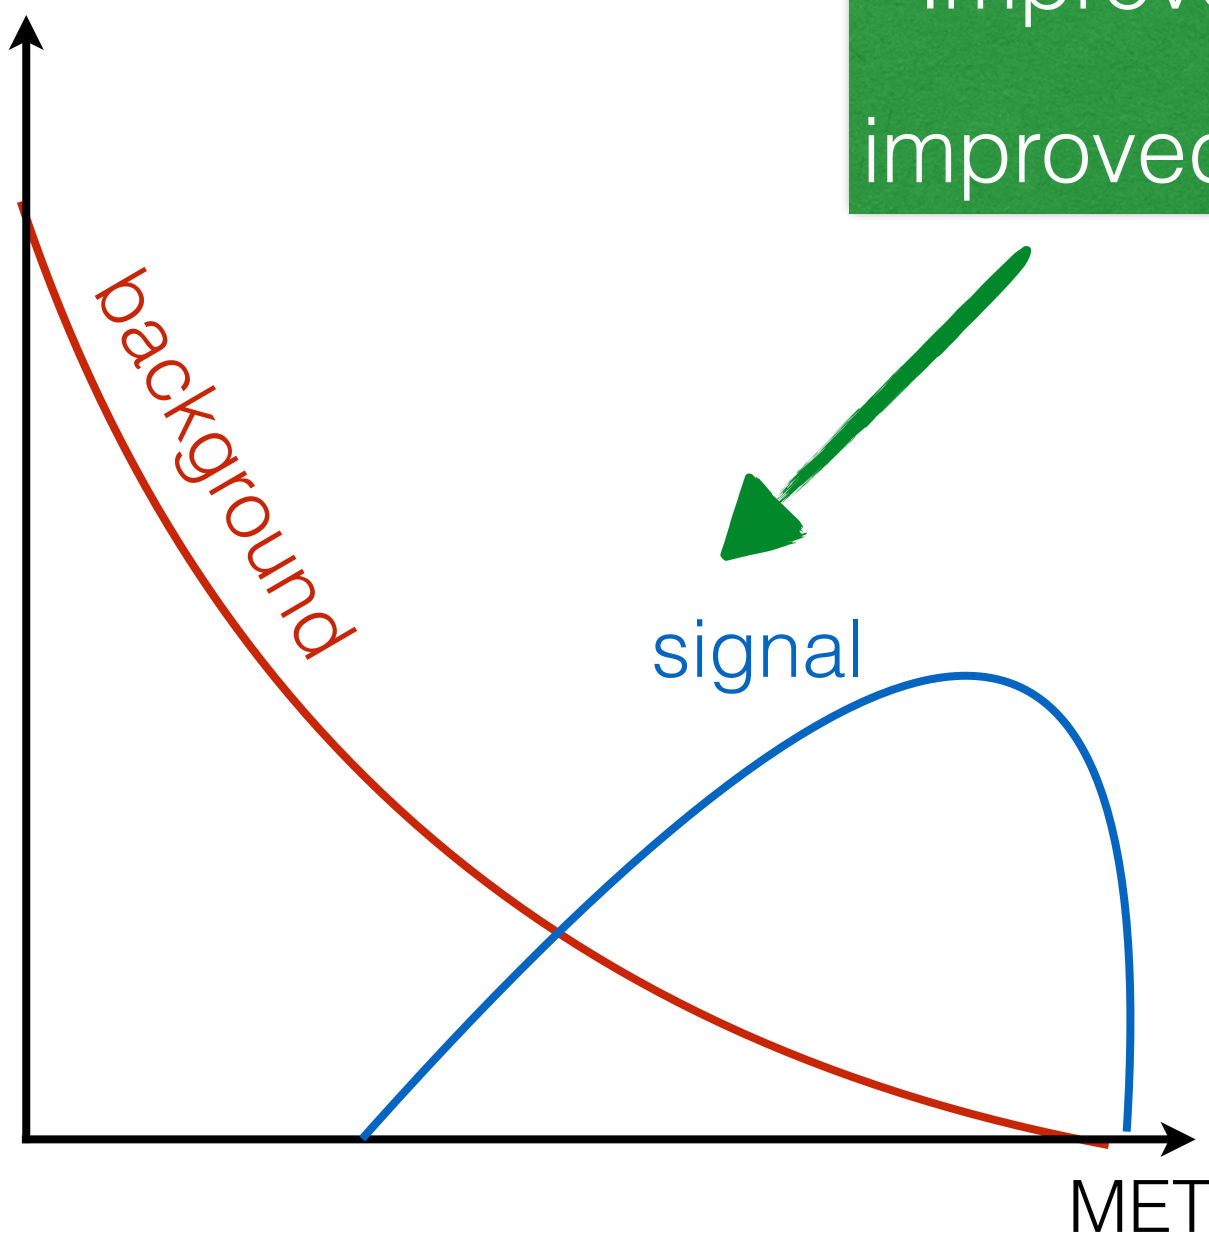
Eur. Phys. J. C (2017) 77:241

TST is what ATLAS analyses use today!

Marco Valente
Université de Genève

Can we do better?

Improved reconstruction
=
improved signal separation



How can we reconstruct hadronic objects better?

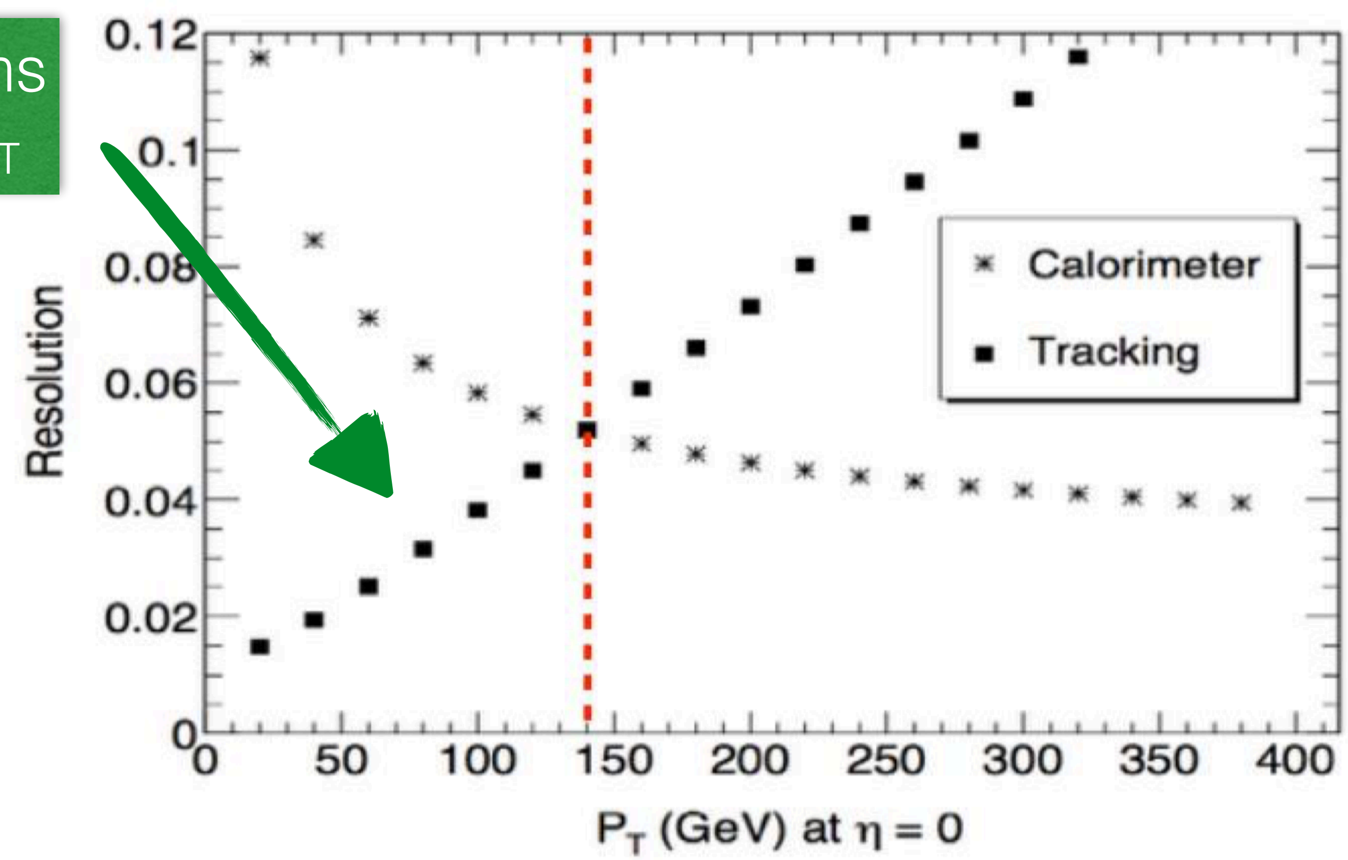
Marco Valente
Université de Genève

Particle Flow reconstruction (1)

The idea behind Particle Flow

- Idea: **combine the tracker and calorimeter information** before jet building!
- Already employed by different experiments (e.g. CMS).
- Expected improvements:
  1. **Optimal p_T resolution** from combined tracker-calorimeter information.
  2. **Removal of charged pileup before jet building.**

Tracker performs better at low p_T

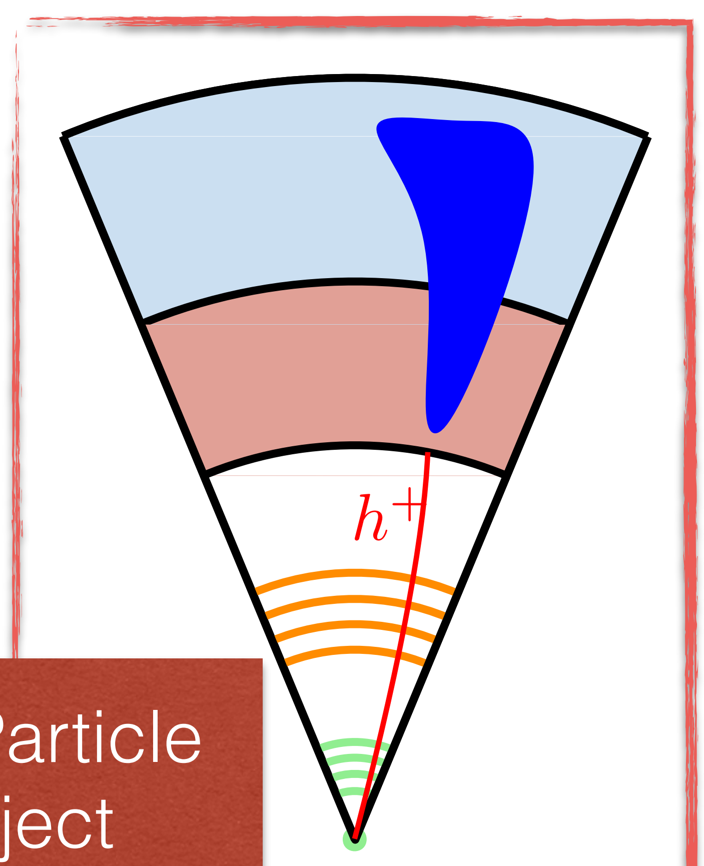


Particle Flow algorithm

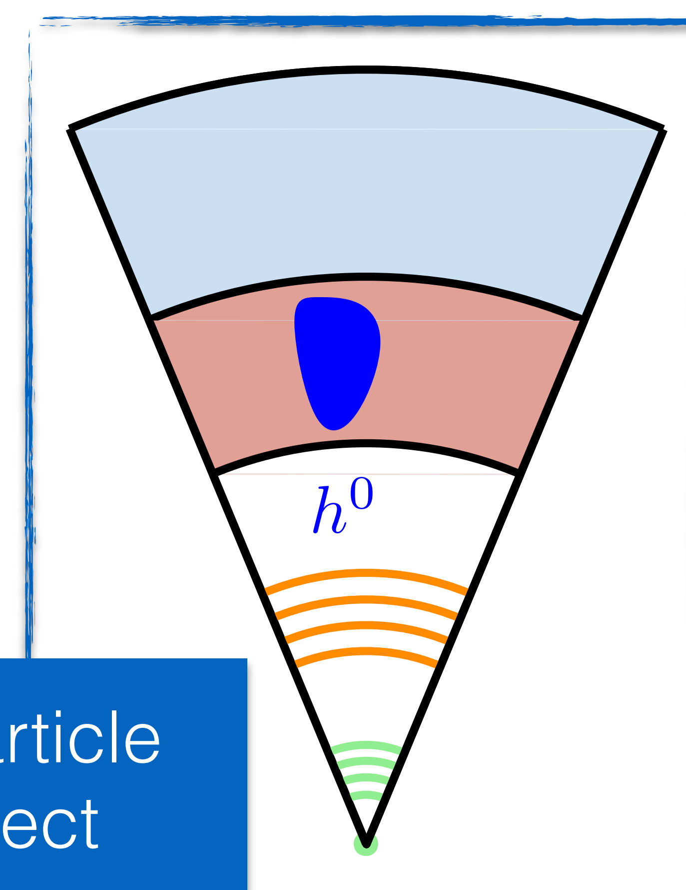
arxiv:1703.10485

- **Inputs:** all tracks and calorimeter clusters.
- **Algorithm:** associate tracks to calo clusters and combine informations (if charged).
  - Removal of charged energy deposits in the calorimeter for charged and neutral particle identification.
- **Output:** set of charged and neutral Particle Flow objects.

For jet building, we require these to come from the hard scatter vertex



Charged Particle Flow object



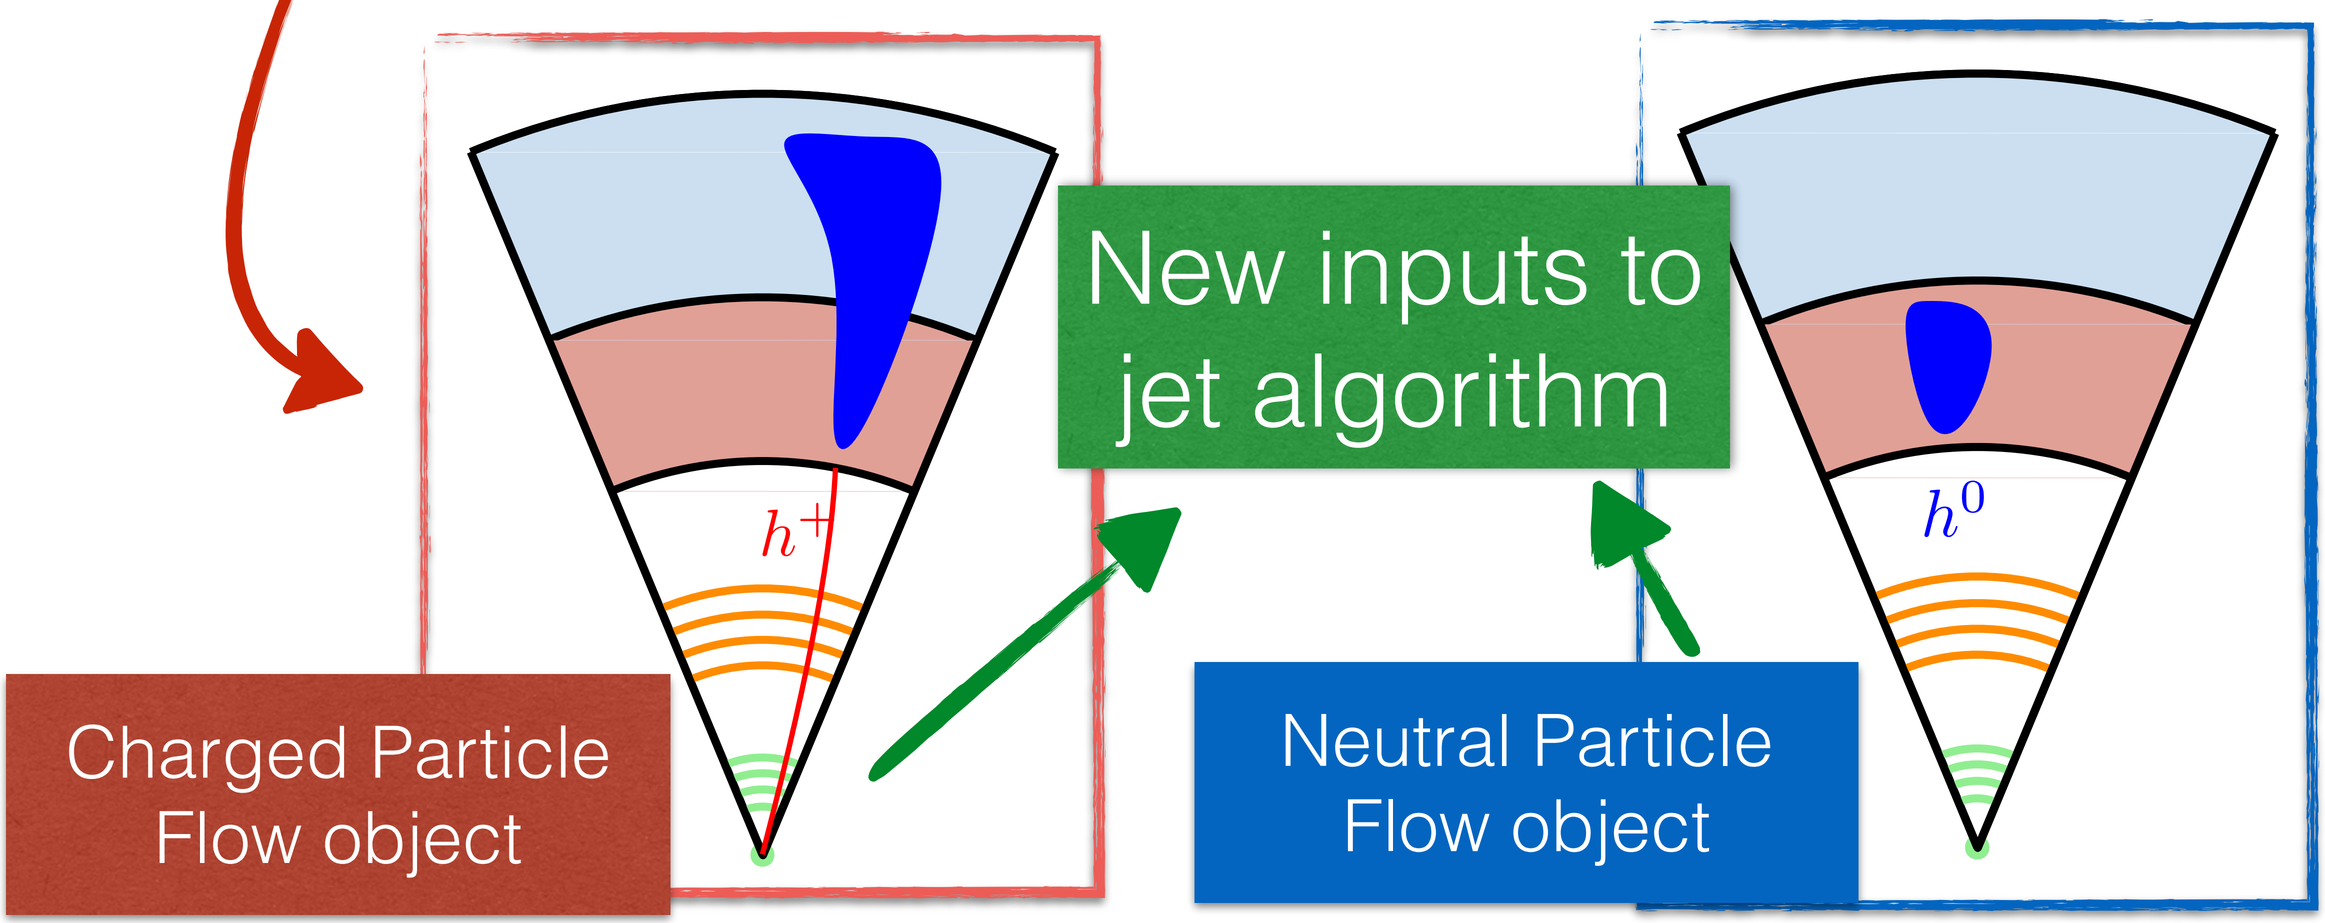
Neutral Particle Flow object

Particle Flow algorithm

arxiv:1703.10485

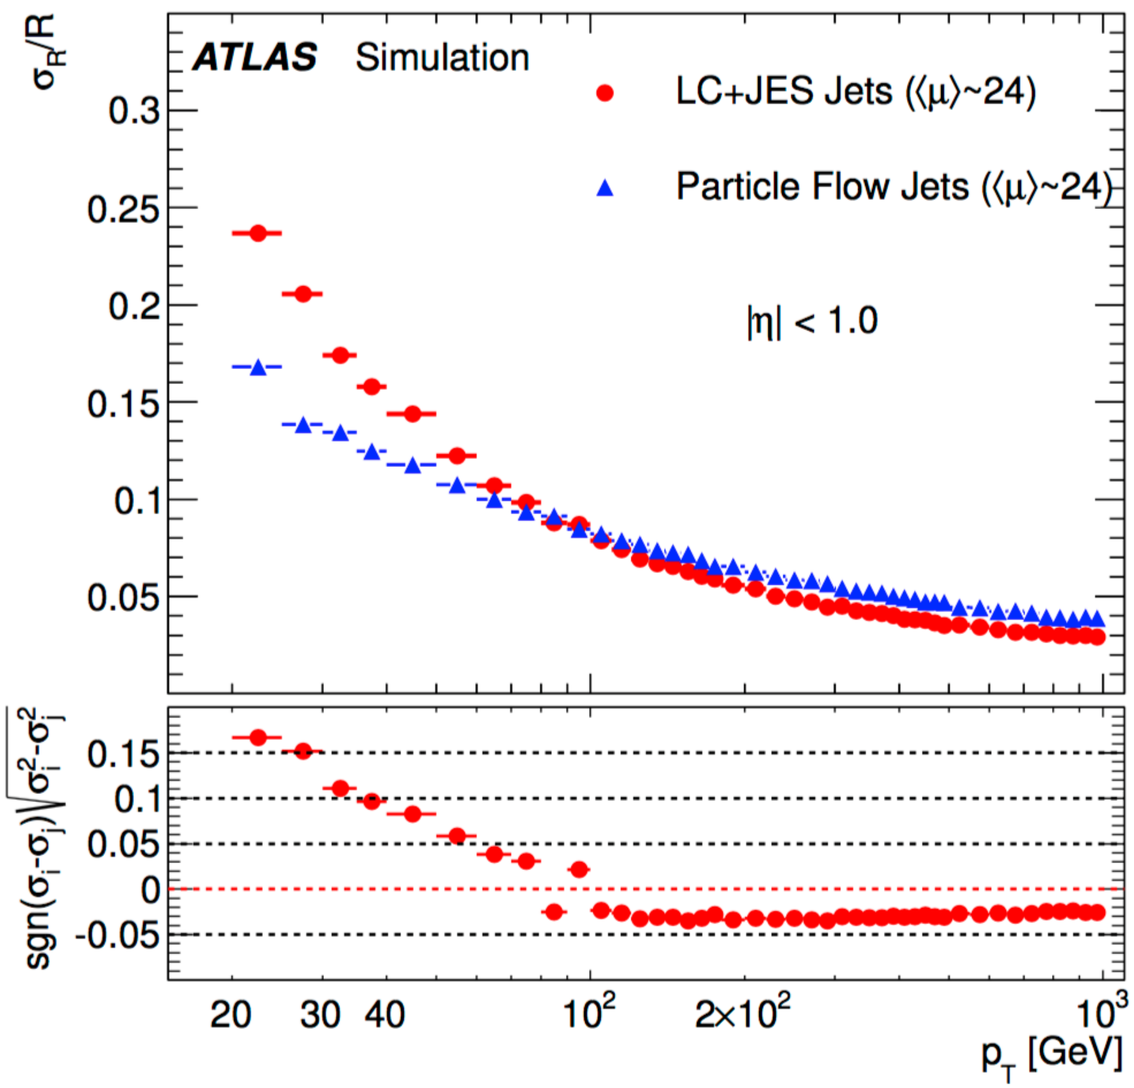
For jet building, we require these to come from the hard scatter vertex

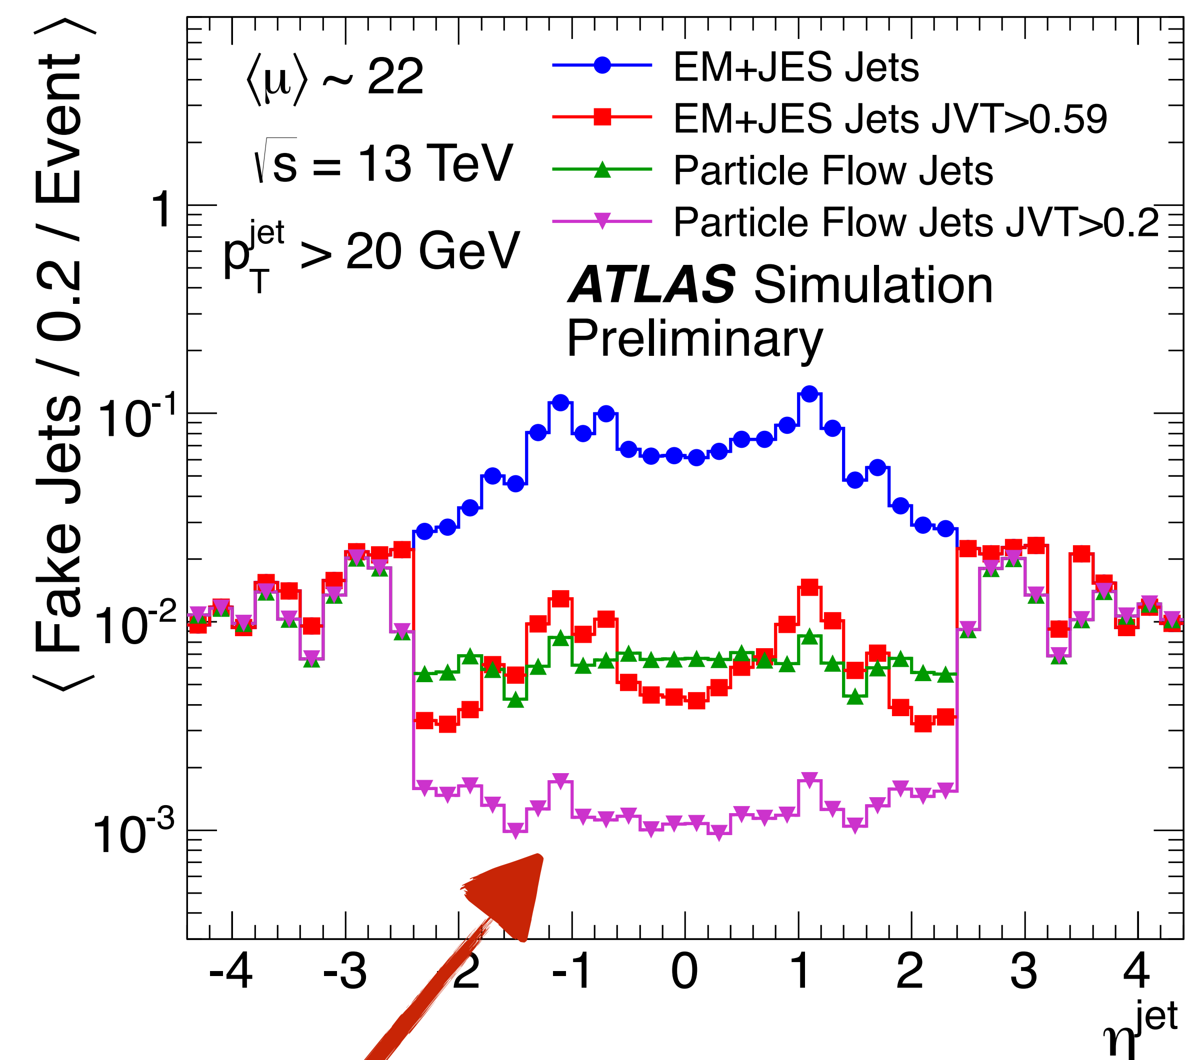
- **Inputs:** all tracks and calorimeter clusters.
- **Algorithm:** associate tracks to calo clusters and combine informations (if charged).
  - Removal of charged energy deposits in the calorimeter for charged and neutral particle identification.
- **Output:** set of charged and neutral Particle Flow objects.



Impact on jets

Better resolution at low p_T thanks to the tracker information





After application of tracker information, pileup jet rejection is better with Particle Flow!

Particle Flow reconstruction and searches for supersymmetry with large jet multiplicities at the ATLAS experiment

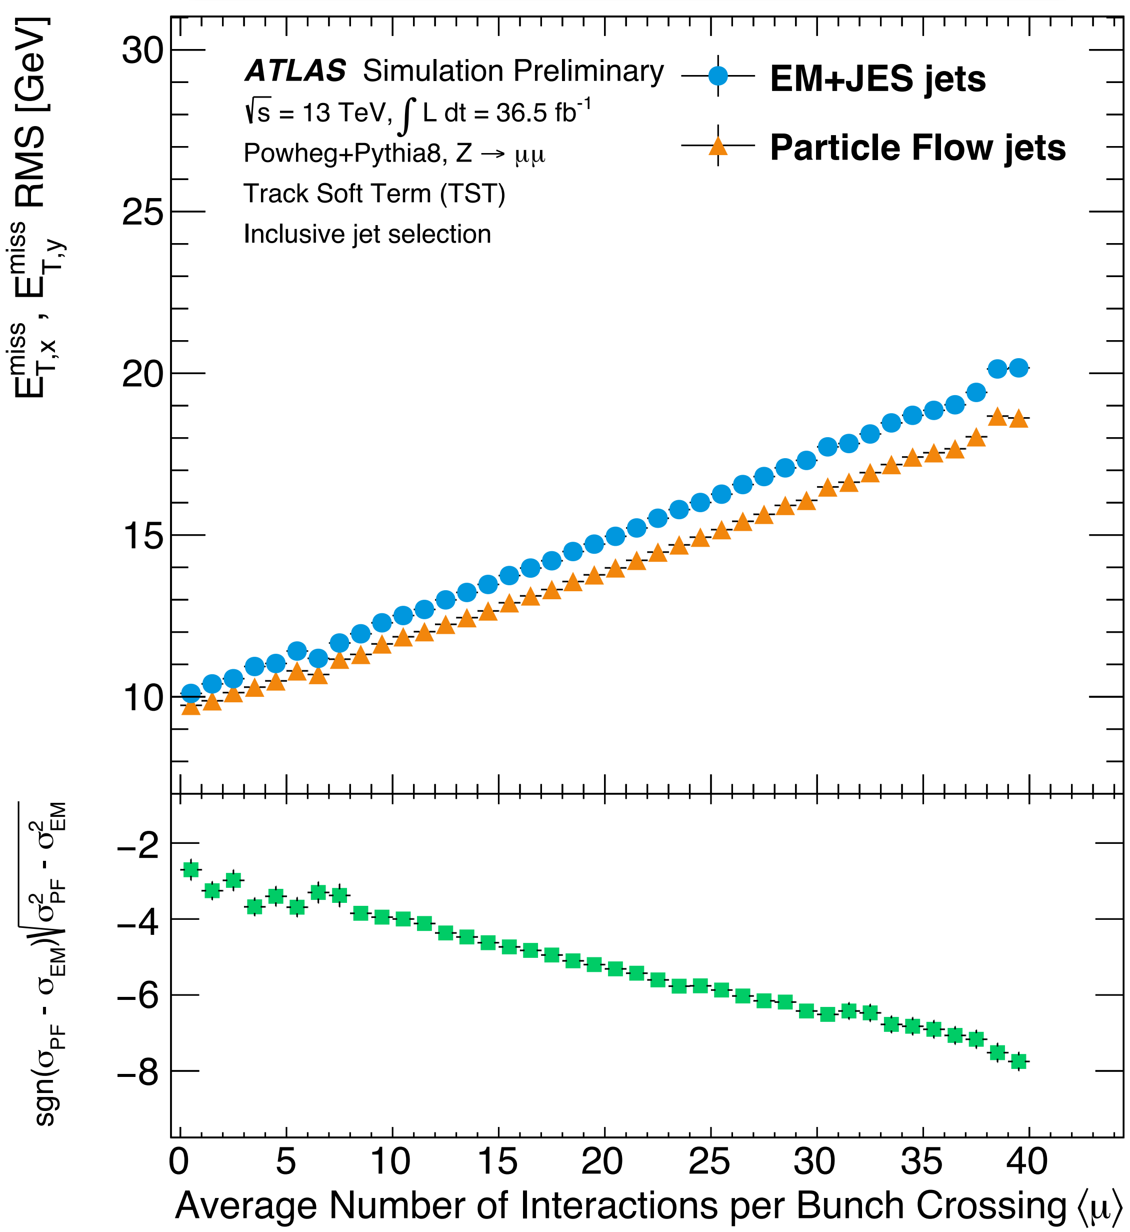
Marco Valente
Université de Genève

- 1
- 2
- 3

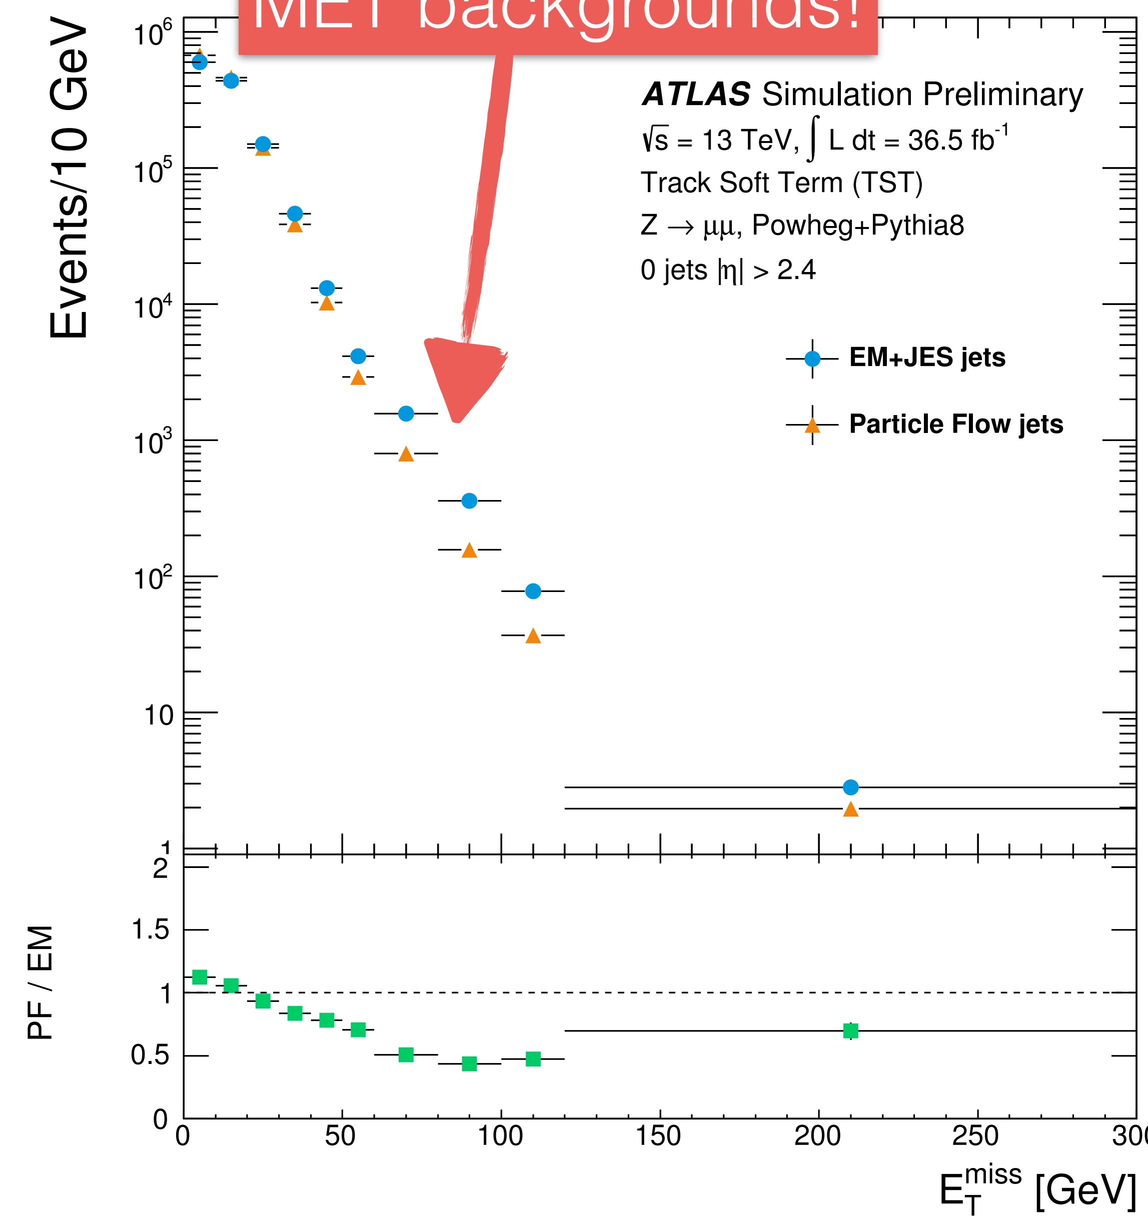
Impact on MET

$$E_{\mathrm{T}}^{\mathrm{miss}} = -\Bigg(\underbrace{\sum_{i\,\in\,\mathrm{muons}} p_{\mathrm{T},i} + \sum_{i\,\in\,\mathrm{electrons}} p_{\mathrm{T},i} + \sum_{i\,\in\,\mathrm{photons}} p_{\mathrm{T},i} + \sum_{i\,\in\,\mathrm{hadronic}\ \tau} p_{\mathrm{T},i} + \sum_{i\,\in\,\mathrm{jets}} p_{\mathrm{T},i}}_{\text{hard term}} + \underbrace{\sum_{i\,\in\,\mathrm{Soft\ Term}} p_{\mathrm{T},i}}_{\text{soft term}} \Bigg)$$

Improved MET resolution!



Lower tails for MET backgrounds!

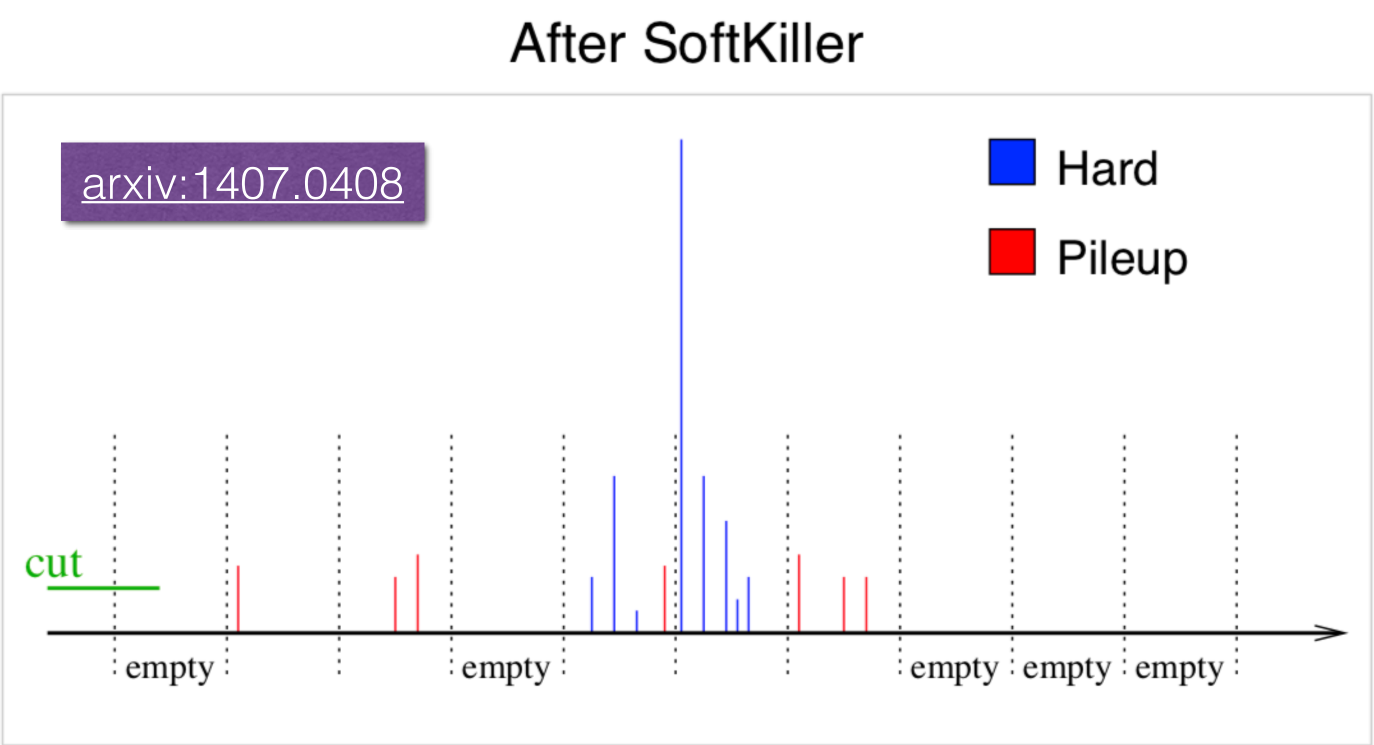


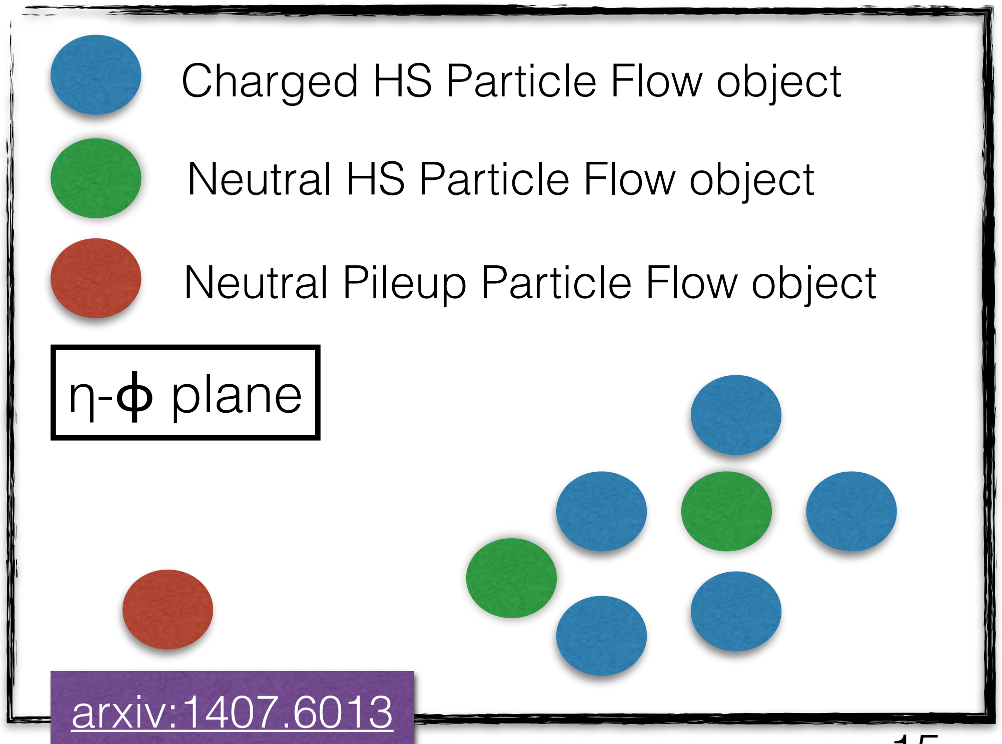
Can we do even better in future?

Particle Flow future prospects (1)

Neutral pileup suppression

- Why not applying pileup suppression also on neutrals?
- Different techniques already exist, but they are extremely simple.
- **Simple because they just look at:**
  1. Particles p_T.
  2. Proximity of neutrals to charged hard scatter particles.

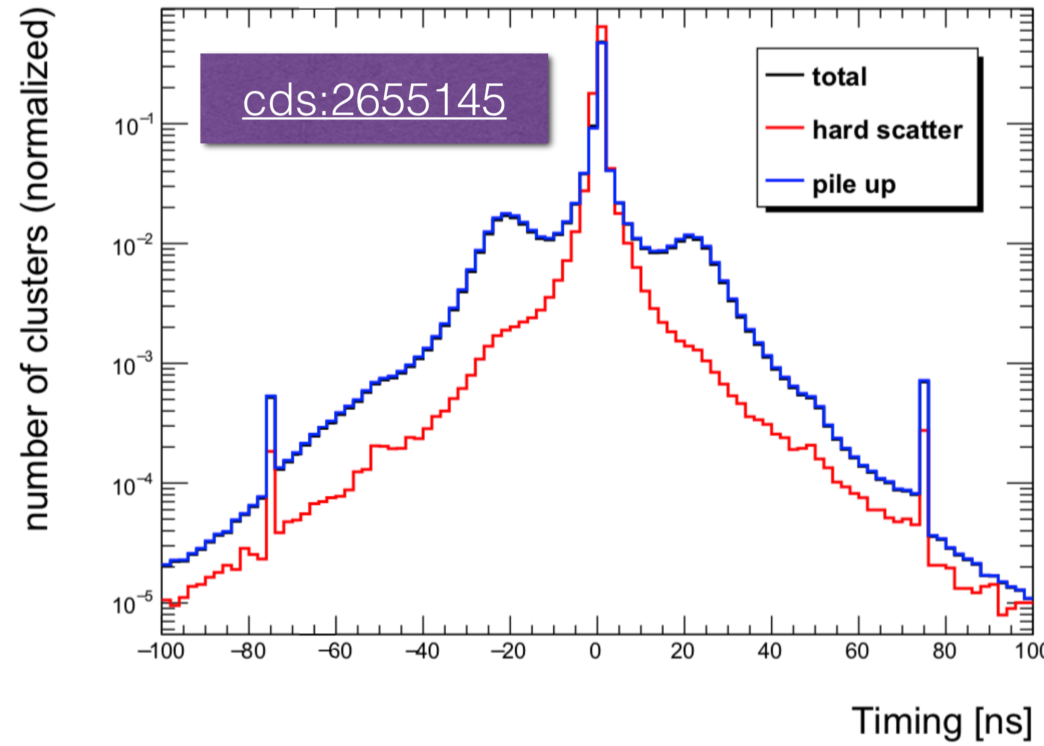


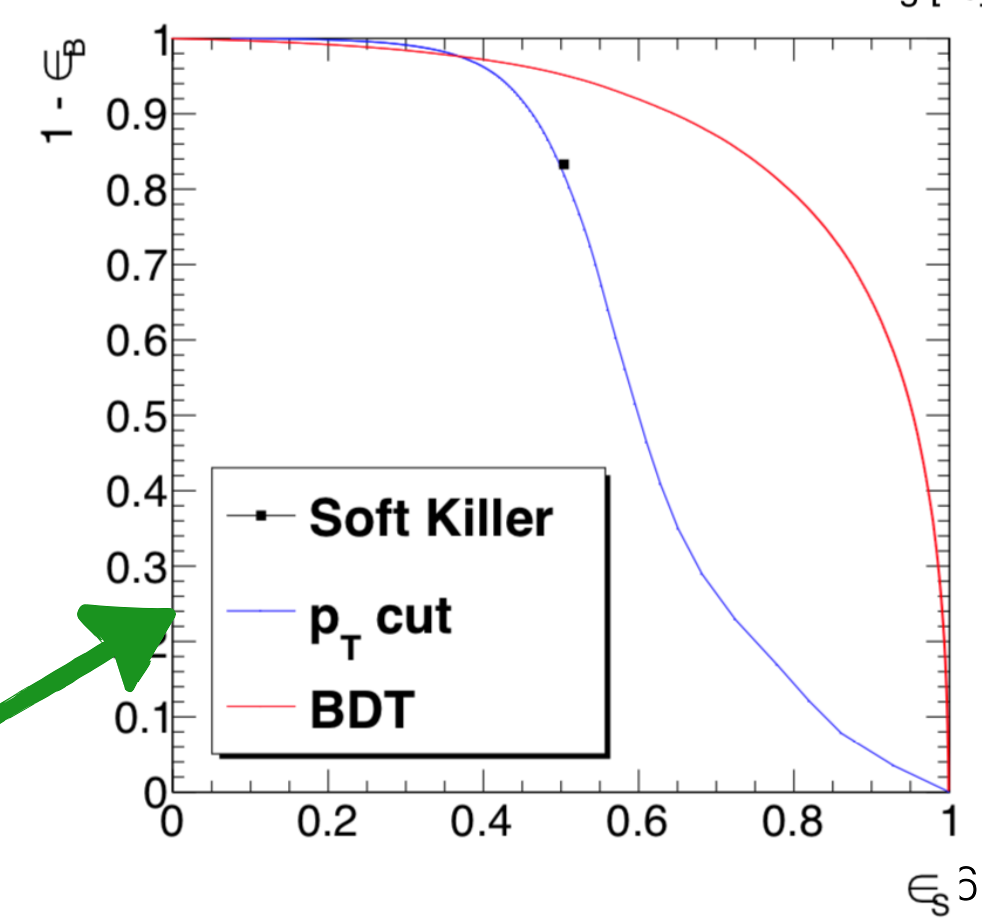


Particle Flow future prospects (2)

Neutral pileup suppression - Alternative approach with multivariate techniques

- **Question:** what if we use more information to remove neutral pileup?
- Decided to explore this with a summer student at CERN in 2018.
- A lot of possibly **useful variables**:
  - Kinematic quantities: p_T, η, ϕ
  - Topocluster timing
  - And others…
- How to combine this information together? → **Machine Learning (ML)**
- It seems that a very simple BDT can do a much better job than a p_T cut!

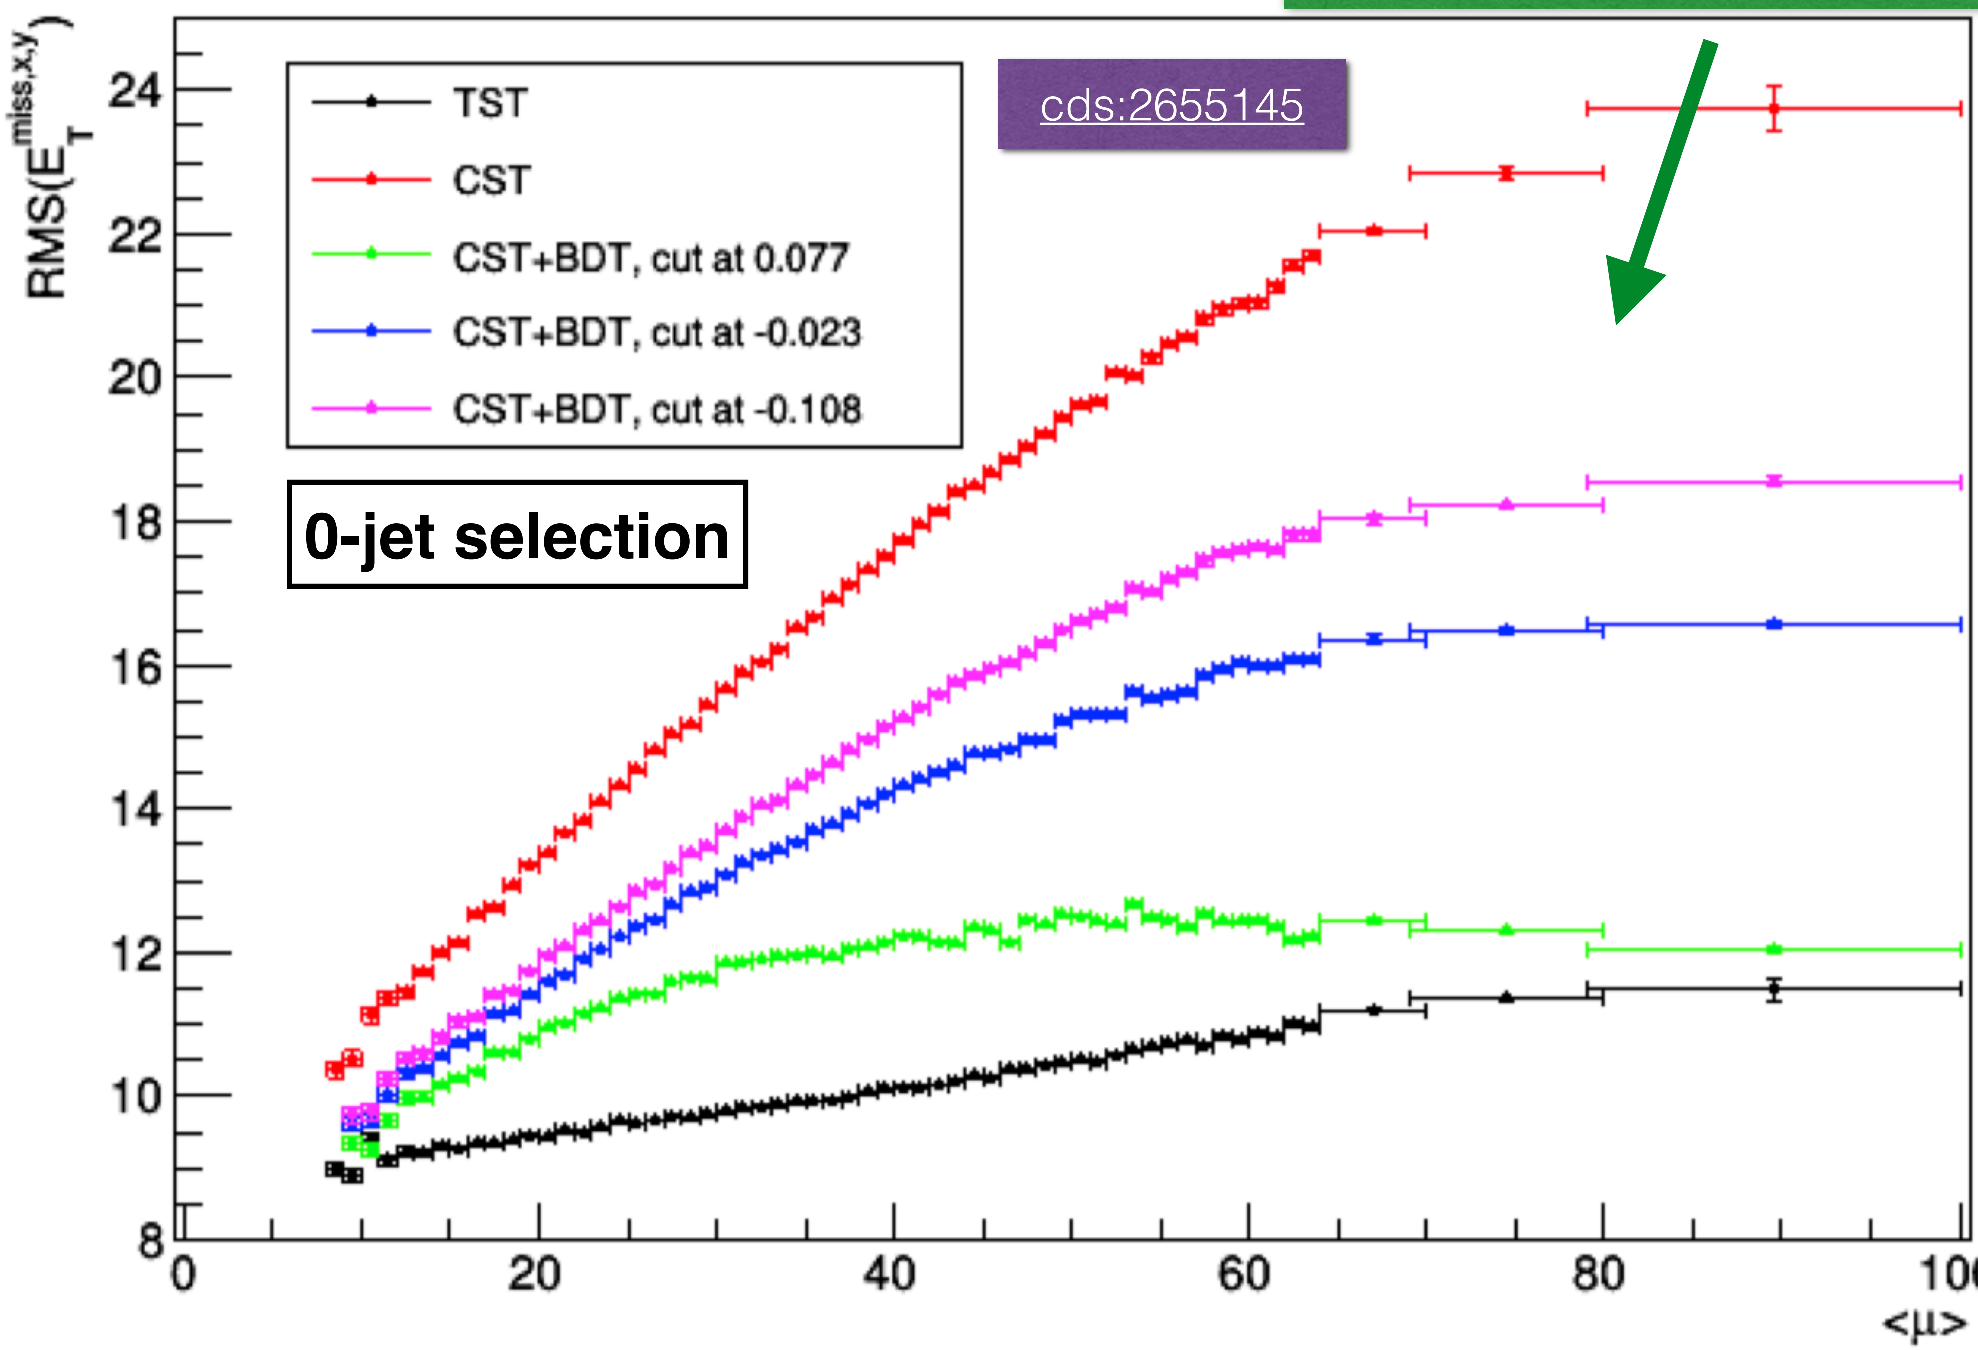




Impact on physics quantities

Marco Valente
Université de Genève

CST resolution improves significantly with BDT

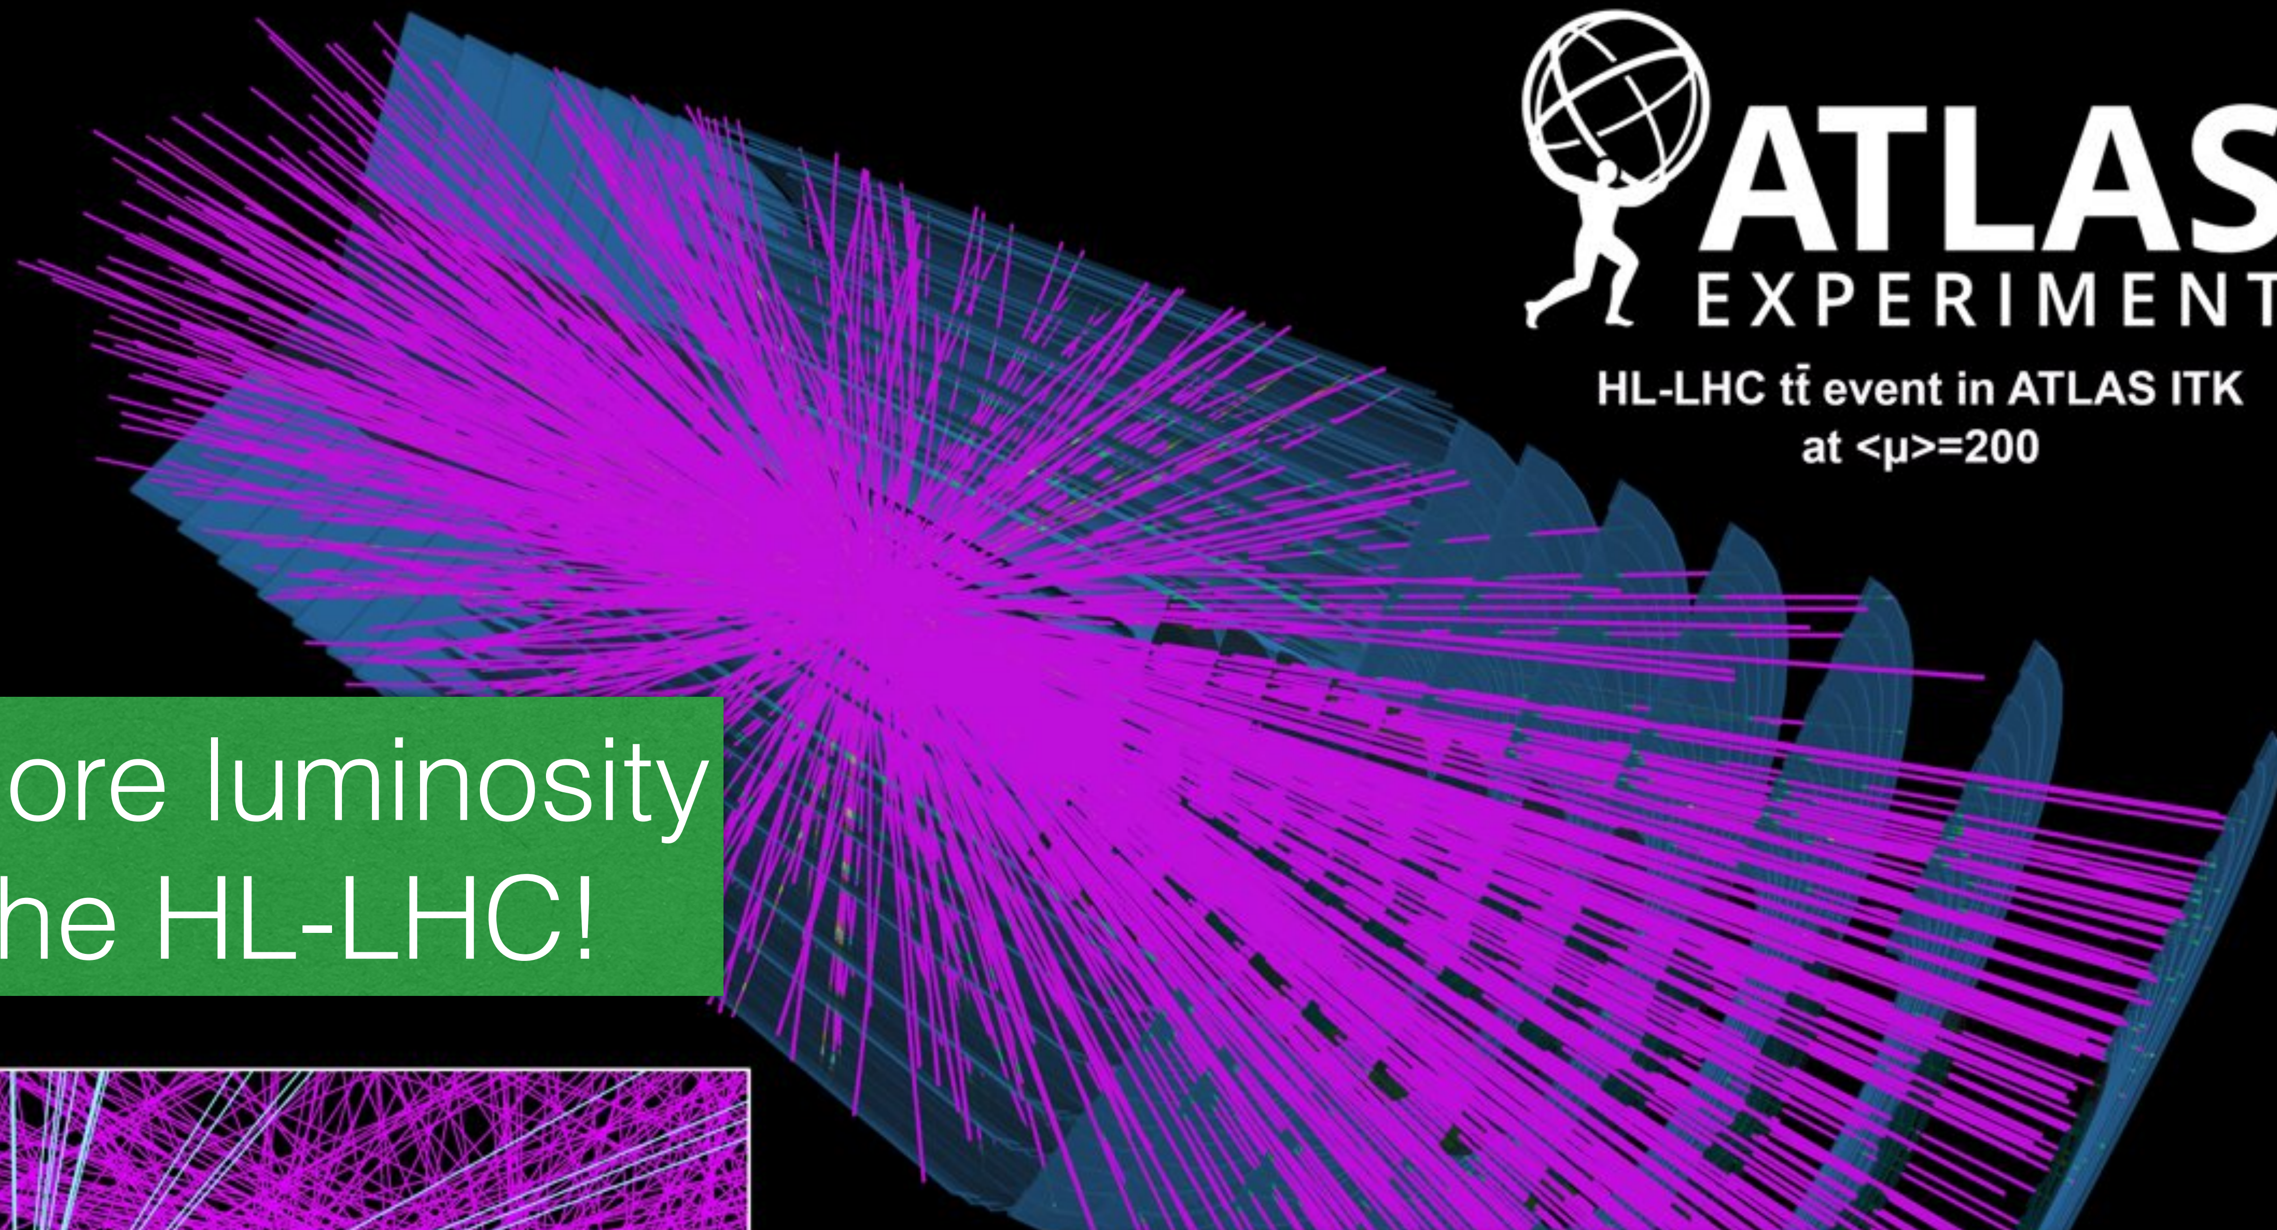


Marco Valente
Université de Genève

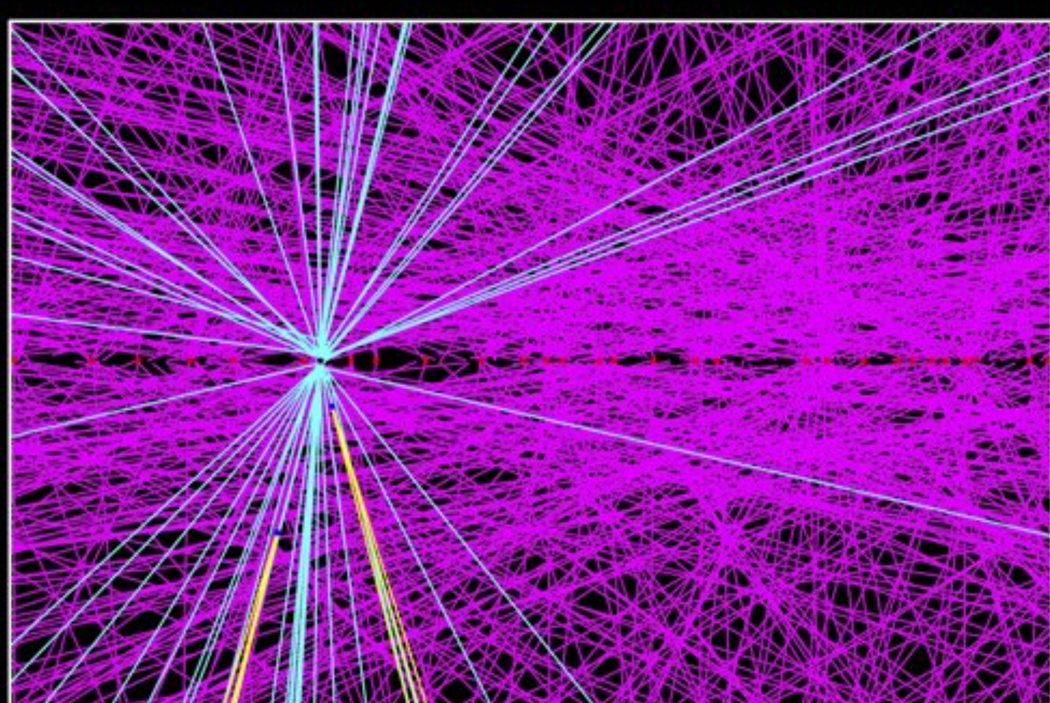
Intermediate summary

- **Hadronic objects are fundamental** for ATLAS physics.
- Until now, **tracking has been used only after jet reconstruction** for pileup suppression.
- **Particle Flow combines calorimeter and tracker information** before jet building providing different improvements.
- Could this be done better in future? Maybe with **neutral pileup mitigation! And also Machine Learning**!

Improvements for physics in future!



x 5 more luminosity
at the HL-LHC!



A lot of chances
to improve even
more at 200 simultaneous
pp collisions!

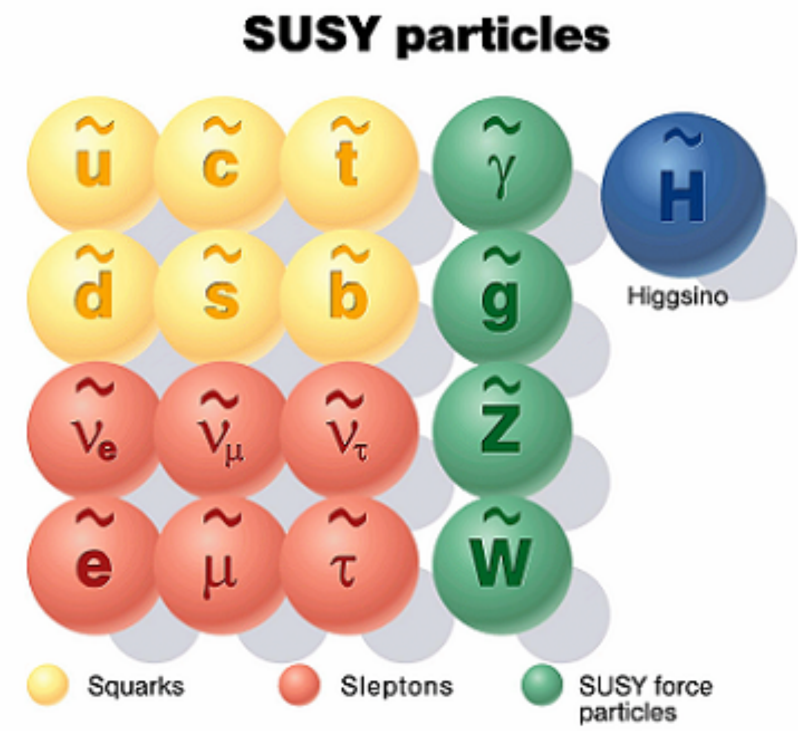
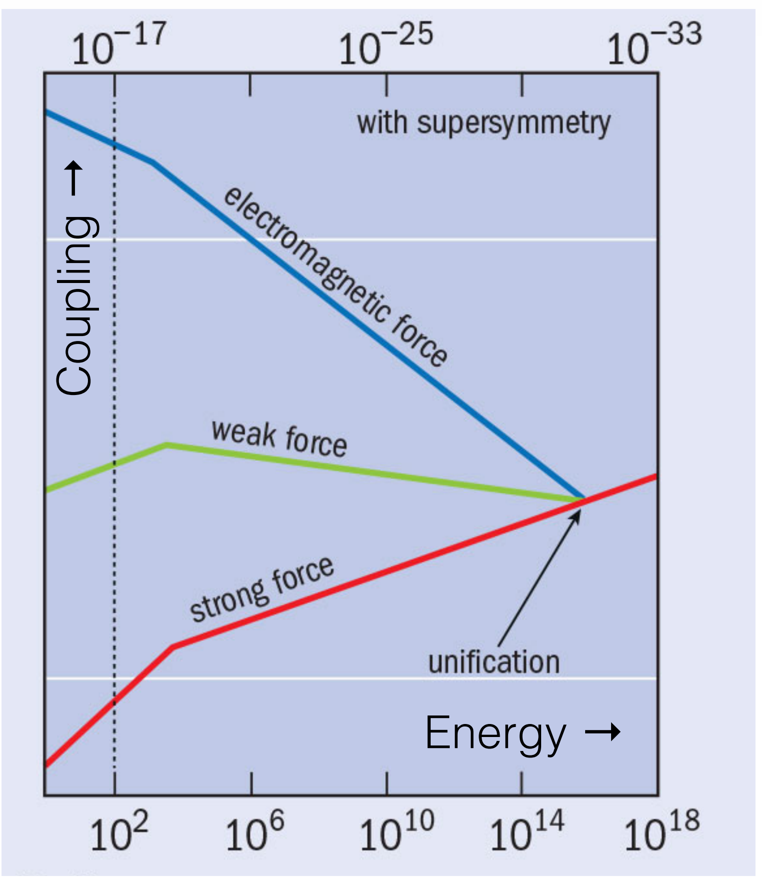
3. **Conclusions and outlook**

Why Supersymmetry?

- Supersymmetry (or SUSY) is one of the most **natural extensions of the Standard Model** (SM).
- Theoretical success due to:
  1. **Naturalness of the SM (**1-2 TeV stop and gluino).
  2. **Dark matter candidate** from Lightest Supersymmetric Particle (LSP).
  3. **Unification of SM with gravity**.
  4. **Unification of elementary forces coupling** at high energy.





What is the signature of SUSY?

1-2 TeV gluinos produced in pairs at the LHC

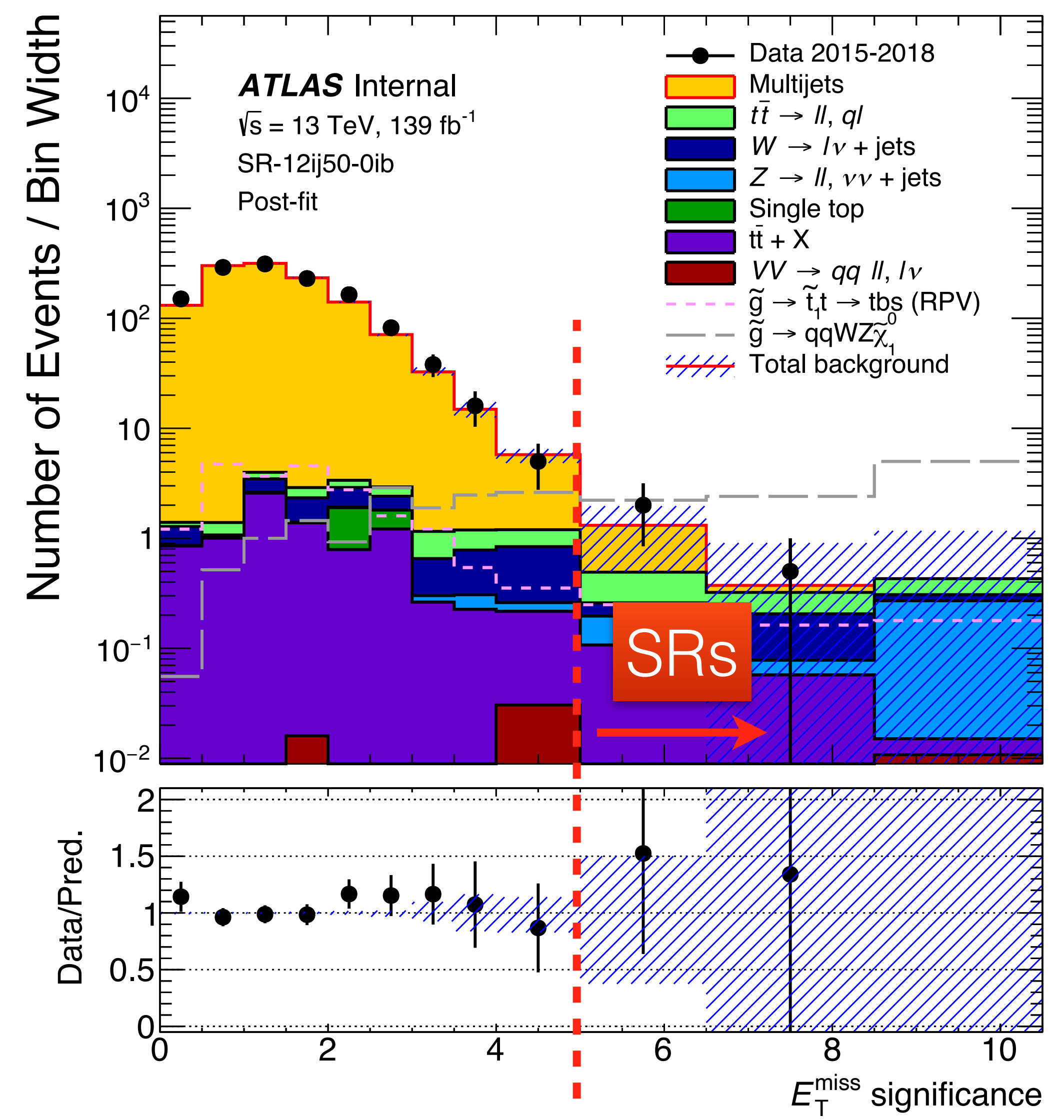
The SUSY multijets 0l analysis

- **Signal Regions SRs:**
  - $N_{jets} \geq 8,9,10,11,12$
  - No leptons.
  - Moderate MET significance (METSig > 5).
  - Additional requirements on b-tagged jets and boosted objects.
- **Backgrounds:**
  - Semi-leptonic: due to misidentified lepton. Dominated by ttbar and W+jets.
  - Multi-jets: all hadronic processes (QCD, full-hadronic ttbar, etc.)
- **Dominant backgrounds in SRs:** multi-jets, ttbar, W+jets

Event-level variable used for boosted event identification

$$M_J^\Sigma = \sum m_j^{R=1.0}$$



Multijets background estimation

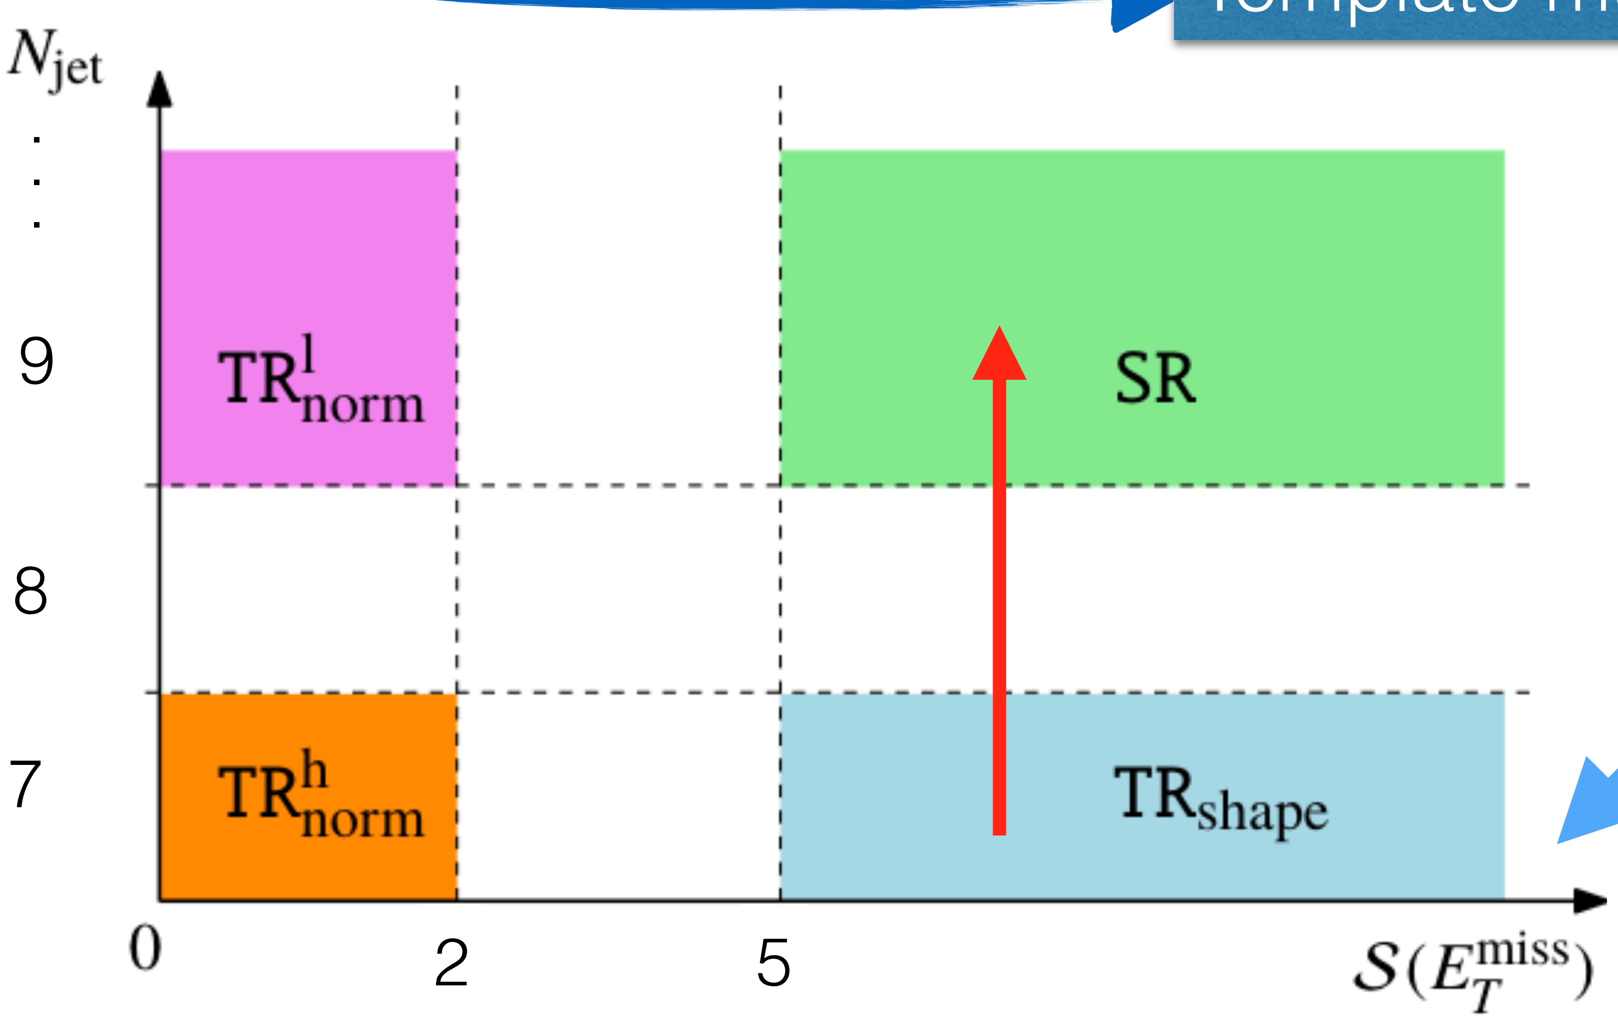
The template method

- **Impossible to simulated multijet background (QCD) at 7-12 jets.**

Need a data-driven background estimation for multijet background.

- <u>Idea:</u> use invariance of MET significance shape to extrapolate multijet background from N_{jets}=7.

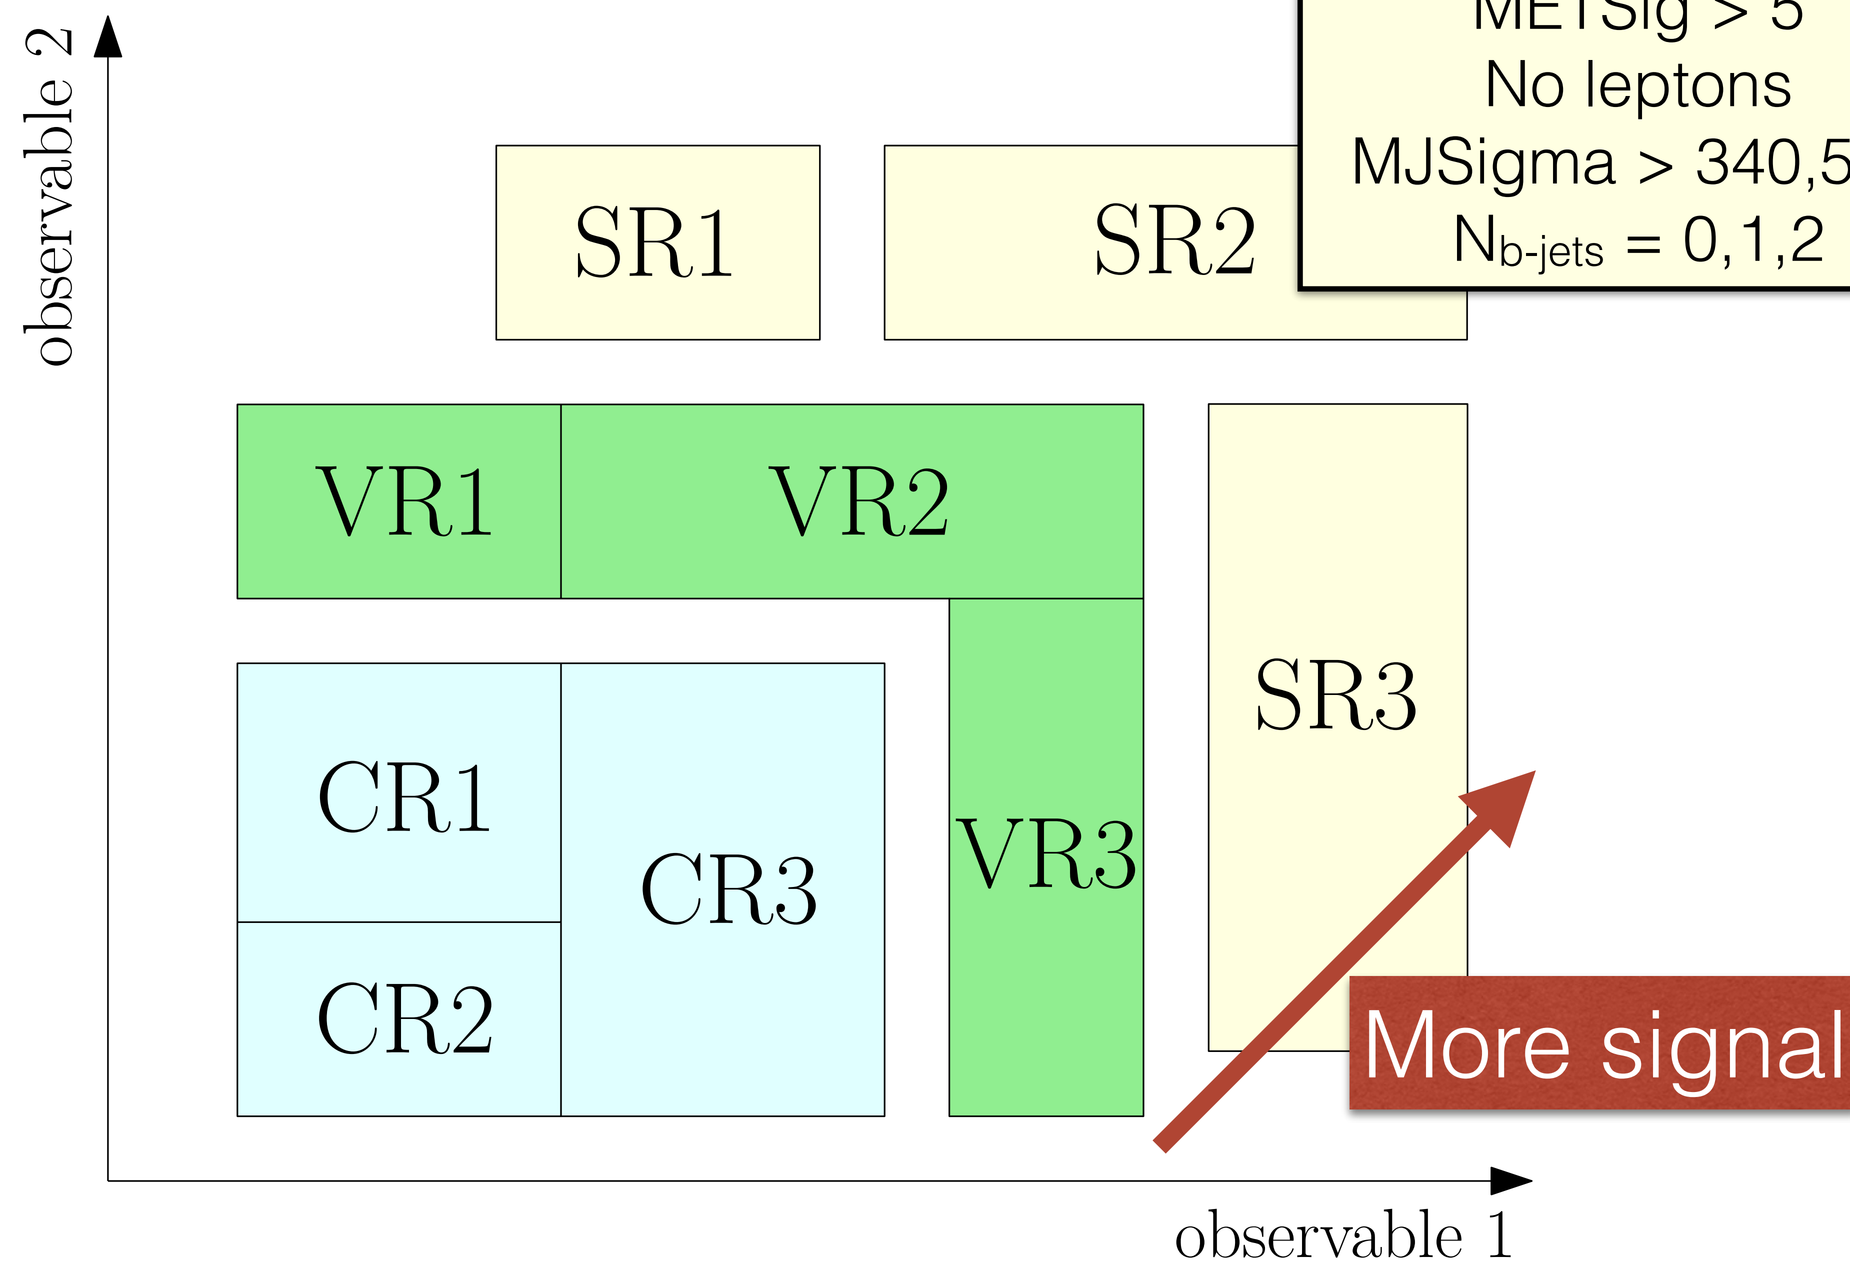
Template multijet estimation



Estimated from subtraction between data and semi-leptonic contributions

Analysis regions

Signal, Control and Validation regions



Signal Regions (SRs)

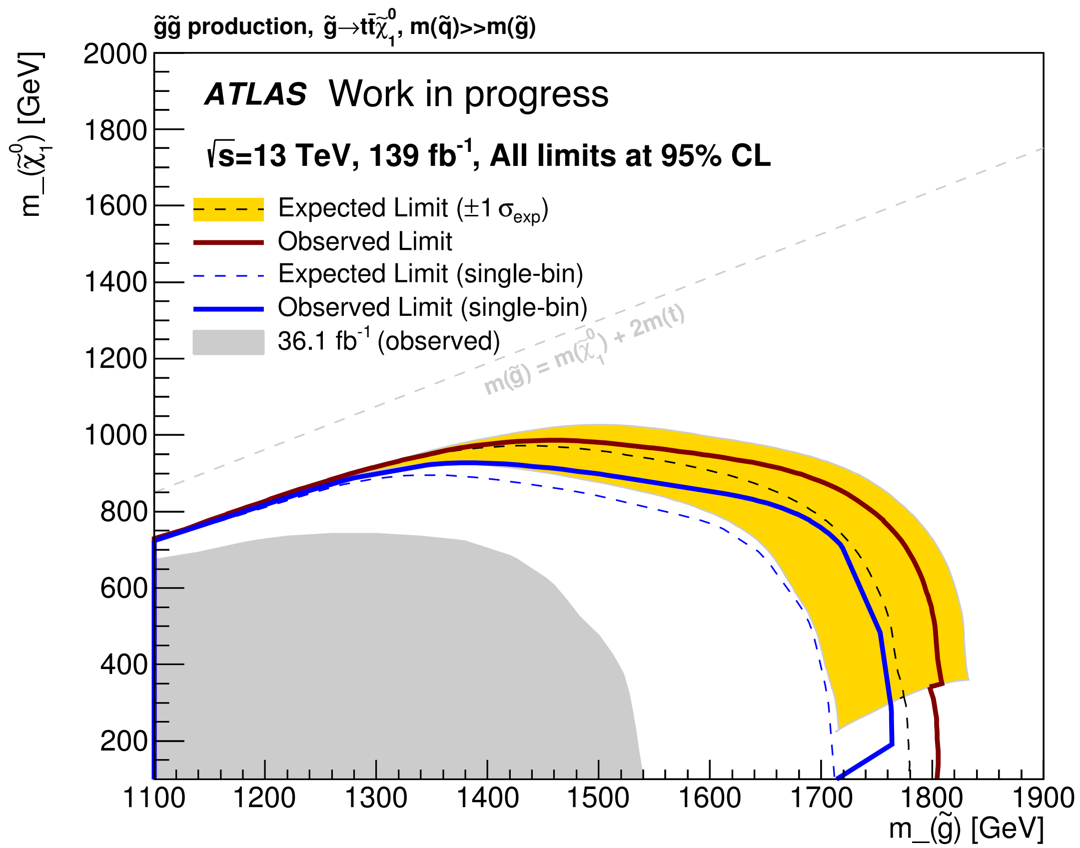
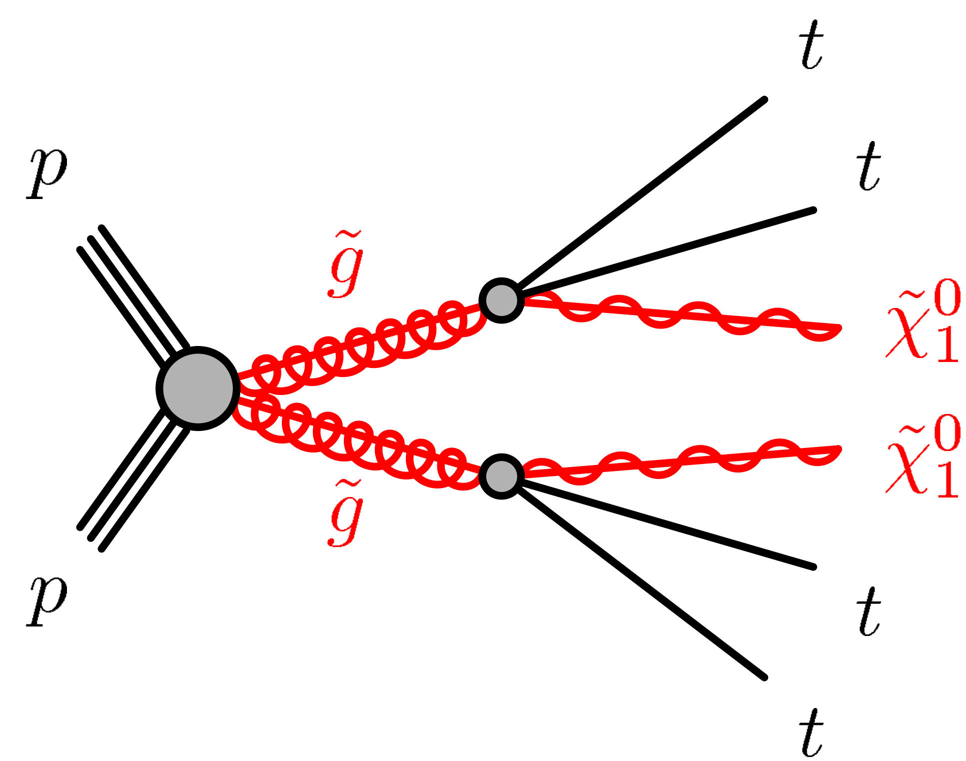
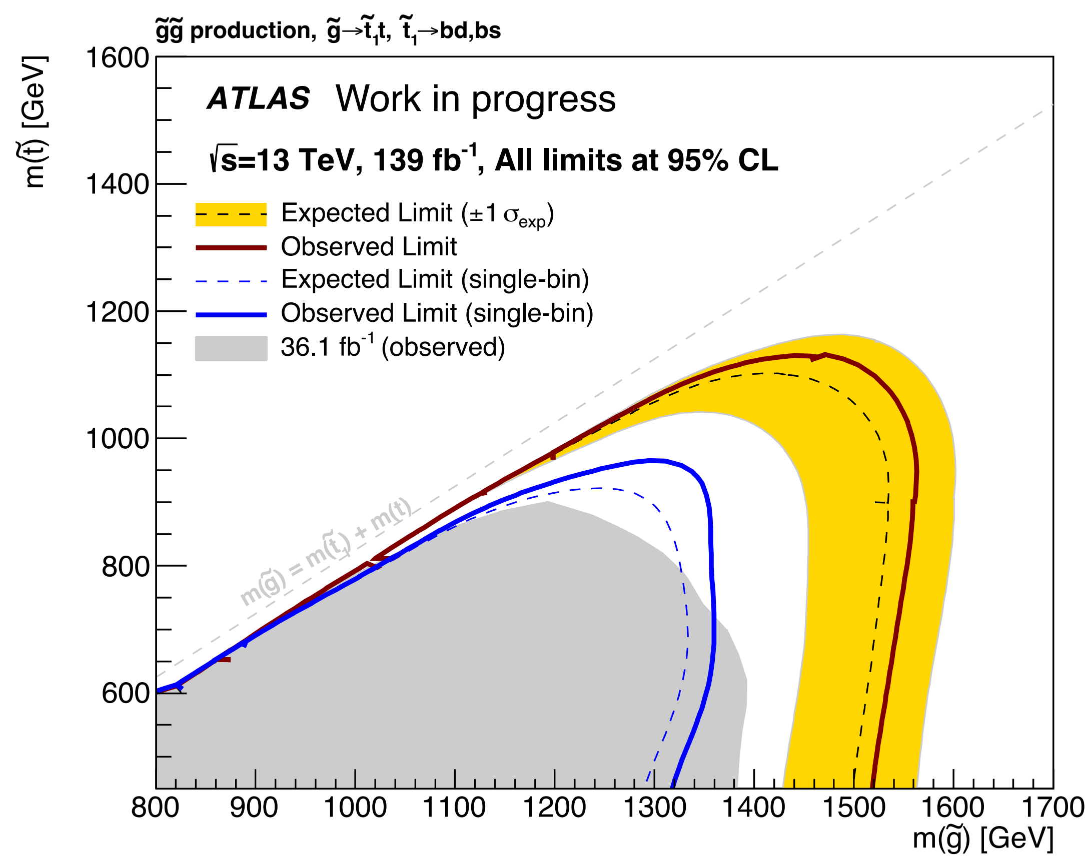
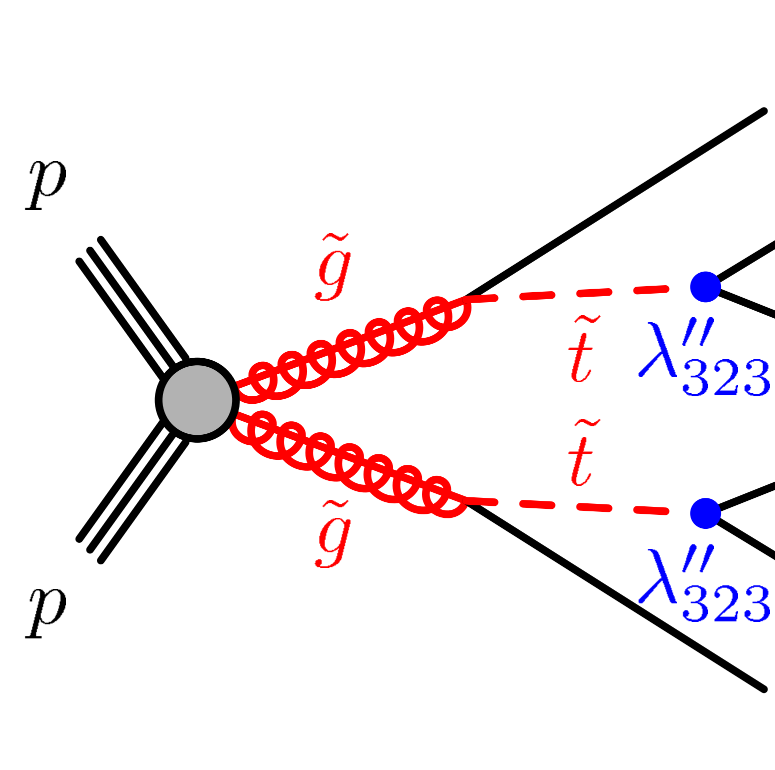
New limits with complete Run 2 dataset





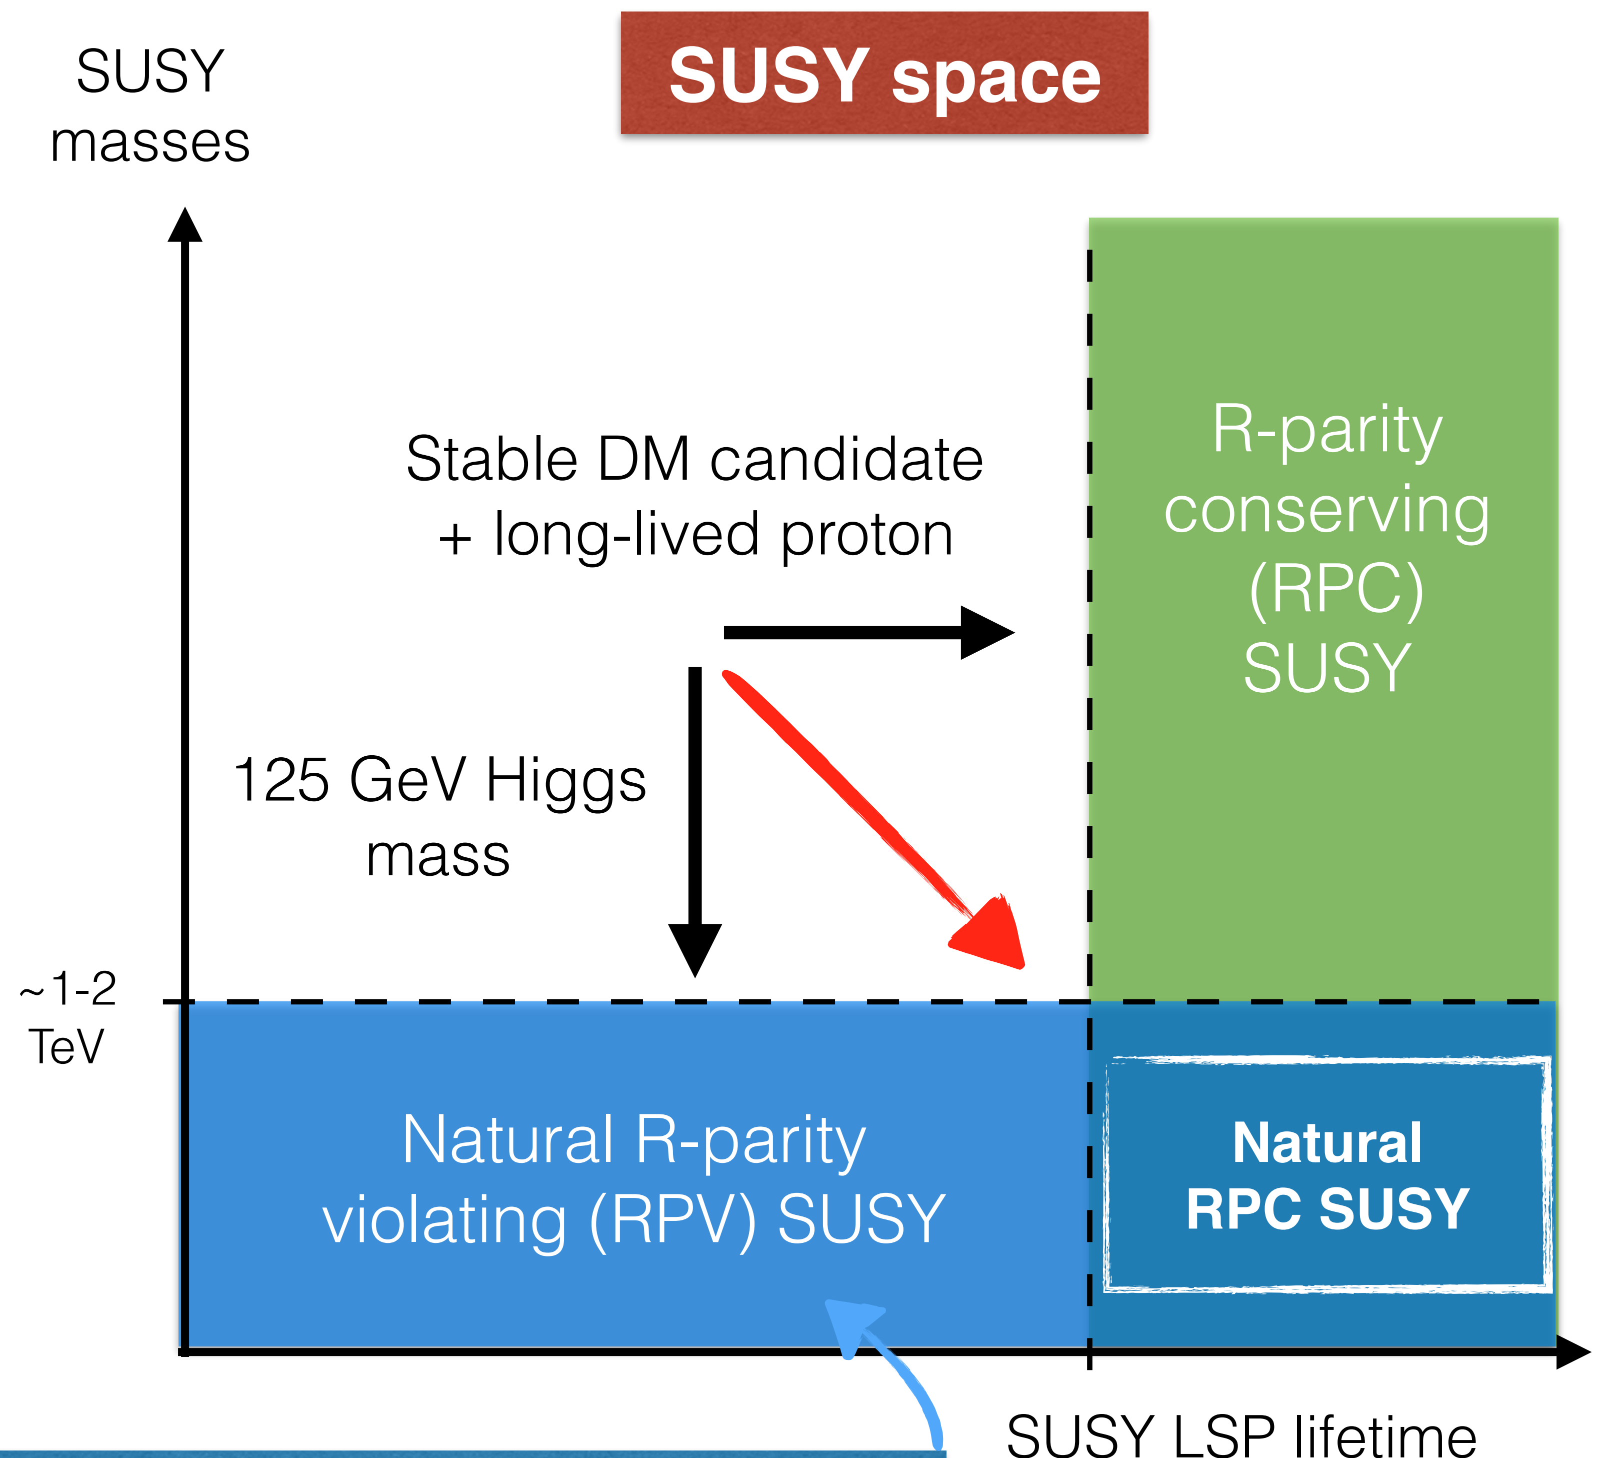




Can we extend our results to more complex SUSY scenarios?

Possible reinterpretations

R-parity violation



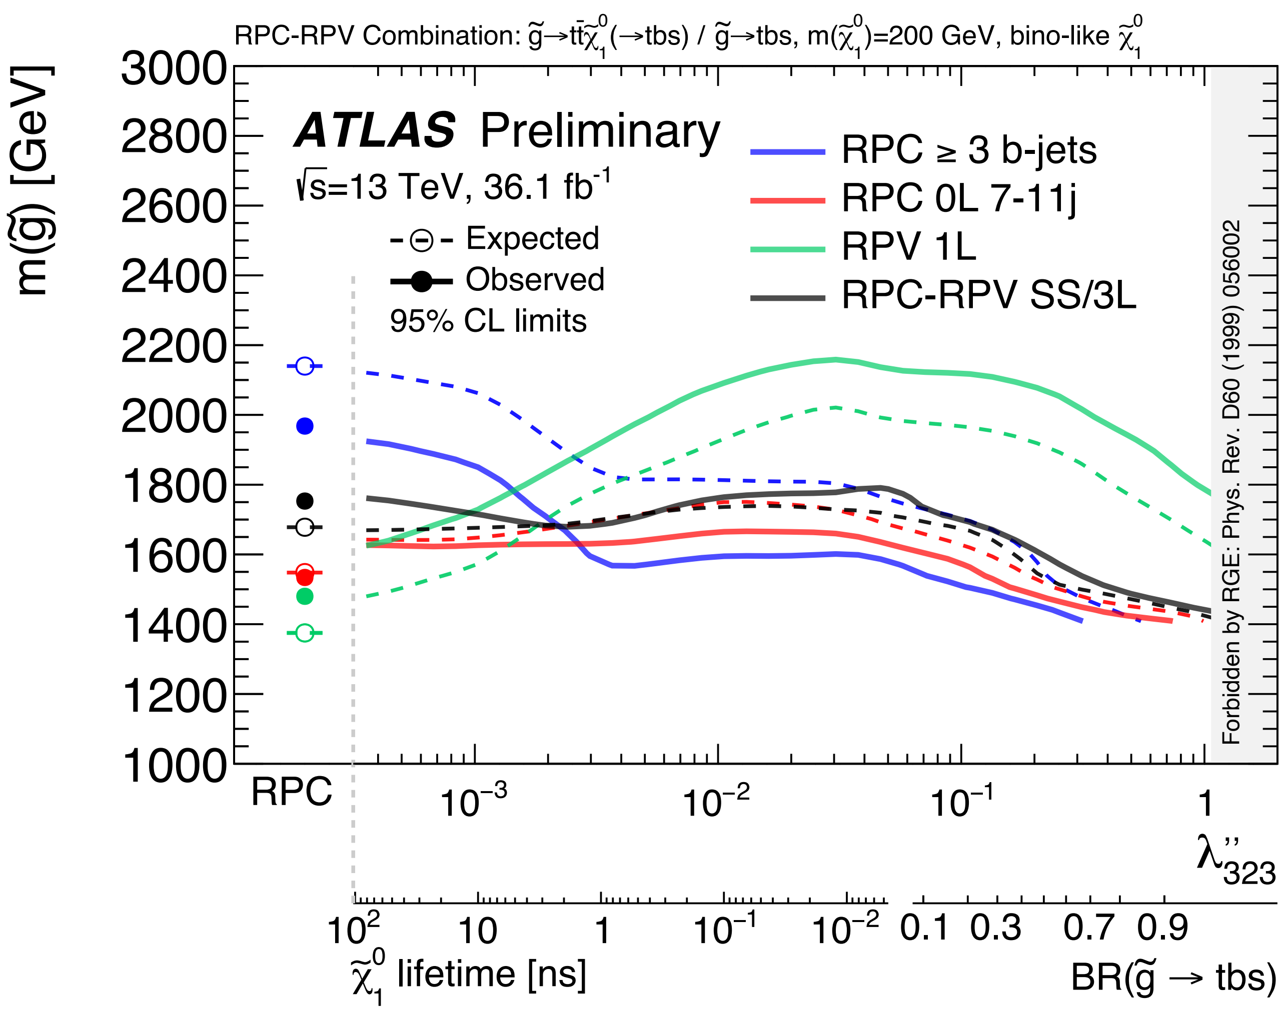
Accessible at the LHC,
lower MET and possibly displaced vertices.

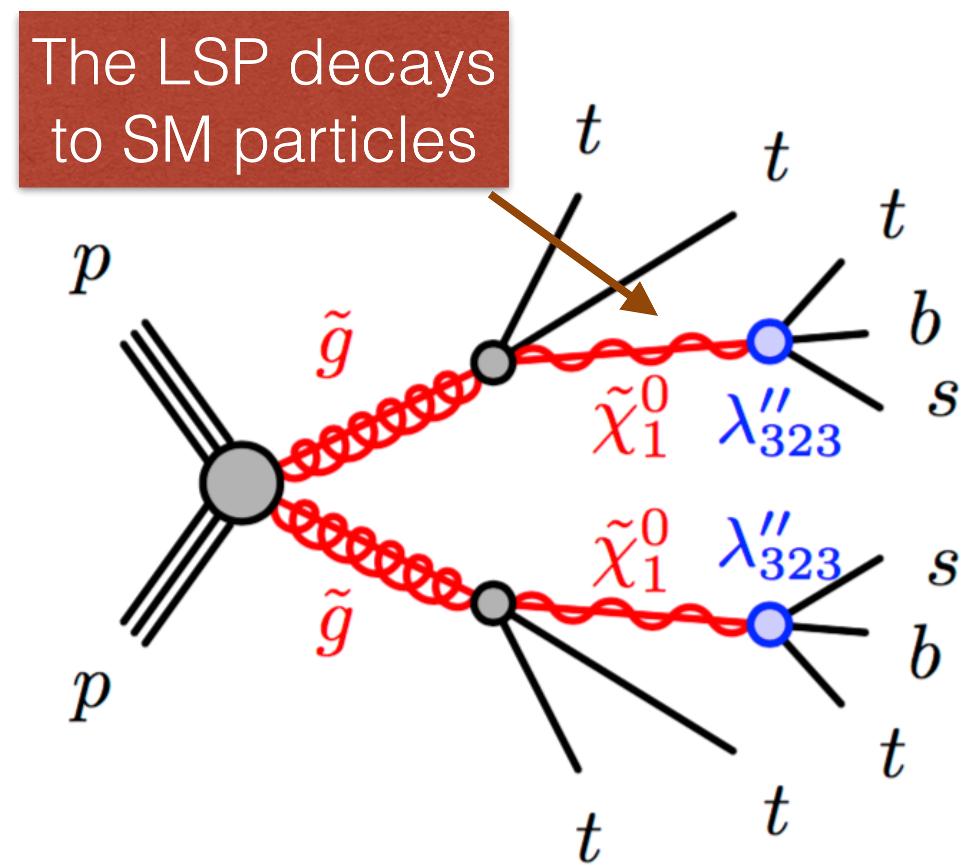
Marco Valente
Université de Genève

RPV reinterpretations

R-parity violation (RPV)

- The analysis has been reinterpreted for R-parity violating (RPV) scenarios where the LSP can decay **having low MET value and potentially displaced** decays.
- 7-12 multijets analysis have stable sensitivity also to different RPV decays. **Reduced sensitivity due to MET significance cut**.
- These scenarios are getting more attention now due to the lack of evidence from standard SUSY searches.





ATLAS-CONF-2018-003

Outline

1. **Hadronic observables: jets and MET**
    1. Why we need hadronic observables?
    2. The ATLAS jet and MET reconstruction.
    3. Particle Flow reconstruction.
    4. Can be do better? Maybe…. neutral pileup mitigation!
2. **Searches for supersymmetry with large jet multiplicities**
    1. What is supersymmetry? How could that be observed?
    2. Searching for supersymmetry with with many jets
    3. Background estimation at 7-12 jets
    4. Results from the full Run-2 dataset
    5. Reinterpretation and current limits
3. **Conclusions and outlook**

Summary and outlook

- **Particle Flow jet/MET reconstruction is now well established** and will play a fundamental role in Run 3 and beyond.
- **Machine Learning** for neutral pileup mitigation seems to provide a possibly **useful tool for improving PFlow even further in future**.
- The **0-lepton multijet analysis** has completed now the processing of the **complete Run 2 dataset**. No excess found.
- **More complex SUSY scenarios are starting to get now more attention** now (RPV, EW SUSY, etc.).
- Also contributed to:
    - **Hardware Track Trigger (HTT) for HL-LHC:** requirements for track-triggers for MET and HH—>4b triggers (inside Phase-II TDAQ TDR now).
    - **MET soft term systematics:** estimation of the MET TST systematics for the ATLAS collaboration.

Future plans and interests

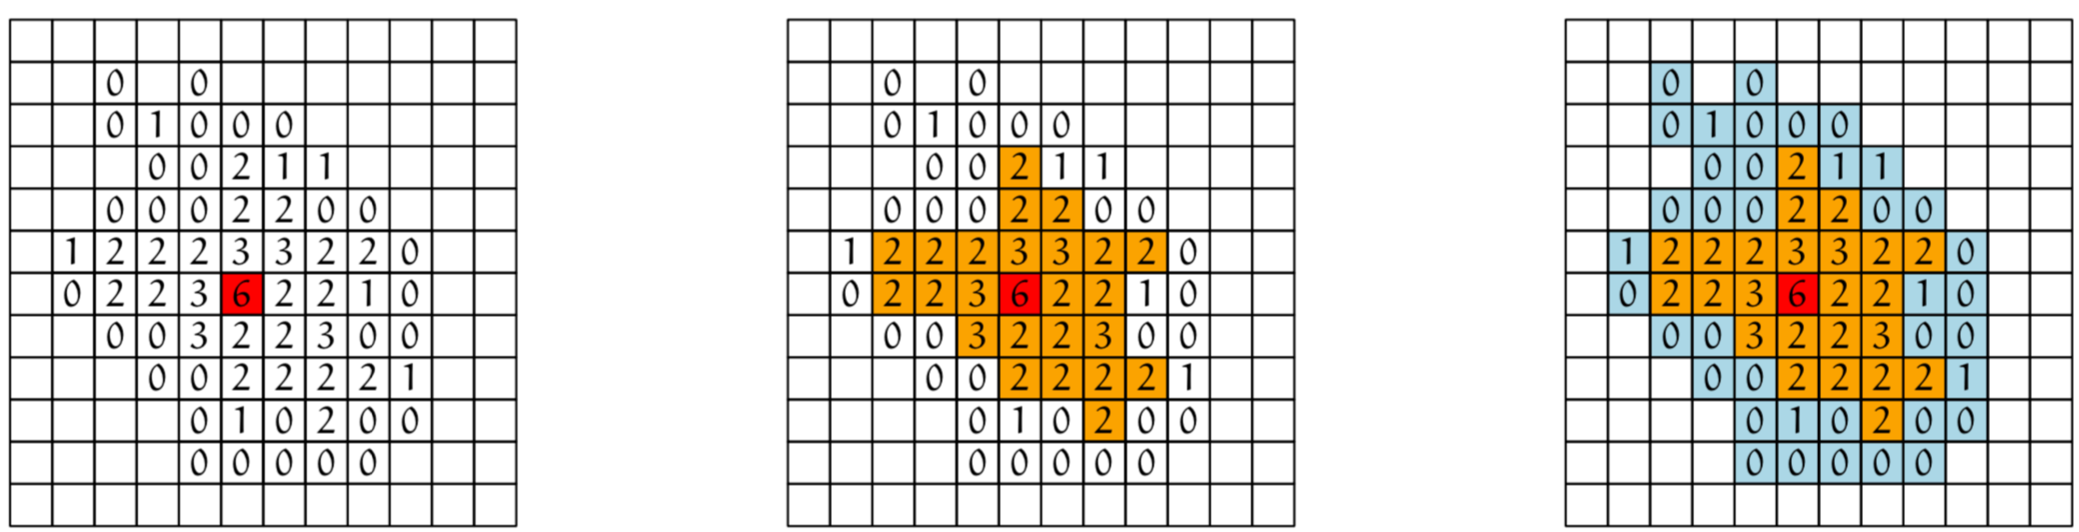
- So far, no sign for new physics at the LHC today. Possible explanations:
  - **New physics is present only at a higher energy scales** than the ones accessible by the LHC.
    - **Need to put better constraints on the SM (Higgs, top, W measurements). EFT interpretations could also be interesting.**
  - **New physics is there,** unobserved because of low signal cross section or possibly unexplored signatures.
    - **Need to increase statistics (HL-LHC) and look at possibly unexplored signatures (displaced decays, etc.).**
- My plans: try to explore these domains (particularly towards HL-LHC) and then maybe try to explore the next generation of colliders (CLIC, FCC, CepC, ILC, …) in the very far future.
- **Enlarge my experience also in the detector sector:** construction of ITk or silicon detector R&D.

Backup

Jet inputs - topoclustering

- Input constituents: ideal representation of final showering particles for jet building.
- Different possible constituent types.
- **ATLAS uses topoclustering constituents** today.
- Topoclustering (420 algorithm):
    1. Seeding from calorimeter cells having ϵ_{cell}>**4**.
    2. Seed growth using calorimeter cells satisfying ϵ_{cell}>**2**.
    3. Border creation using calorimeter cells passing ϵ_{cell}>**0**.
- **Pure calorimeter-based reconstruction** for these objects.

$$\boxed{\epsilon^{\mathrm{EM}}_{\mathrm{cell}} = \frac{E^{\mathrm{EM}}_{\mathrm{cell}}}{\sigma^{\mathrm{EM}}_{\mathrm{noise,cell}}}}$$

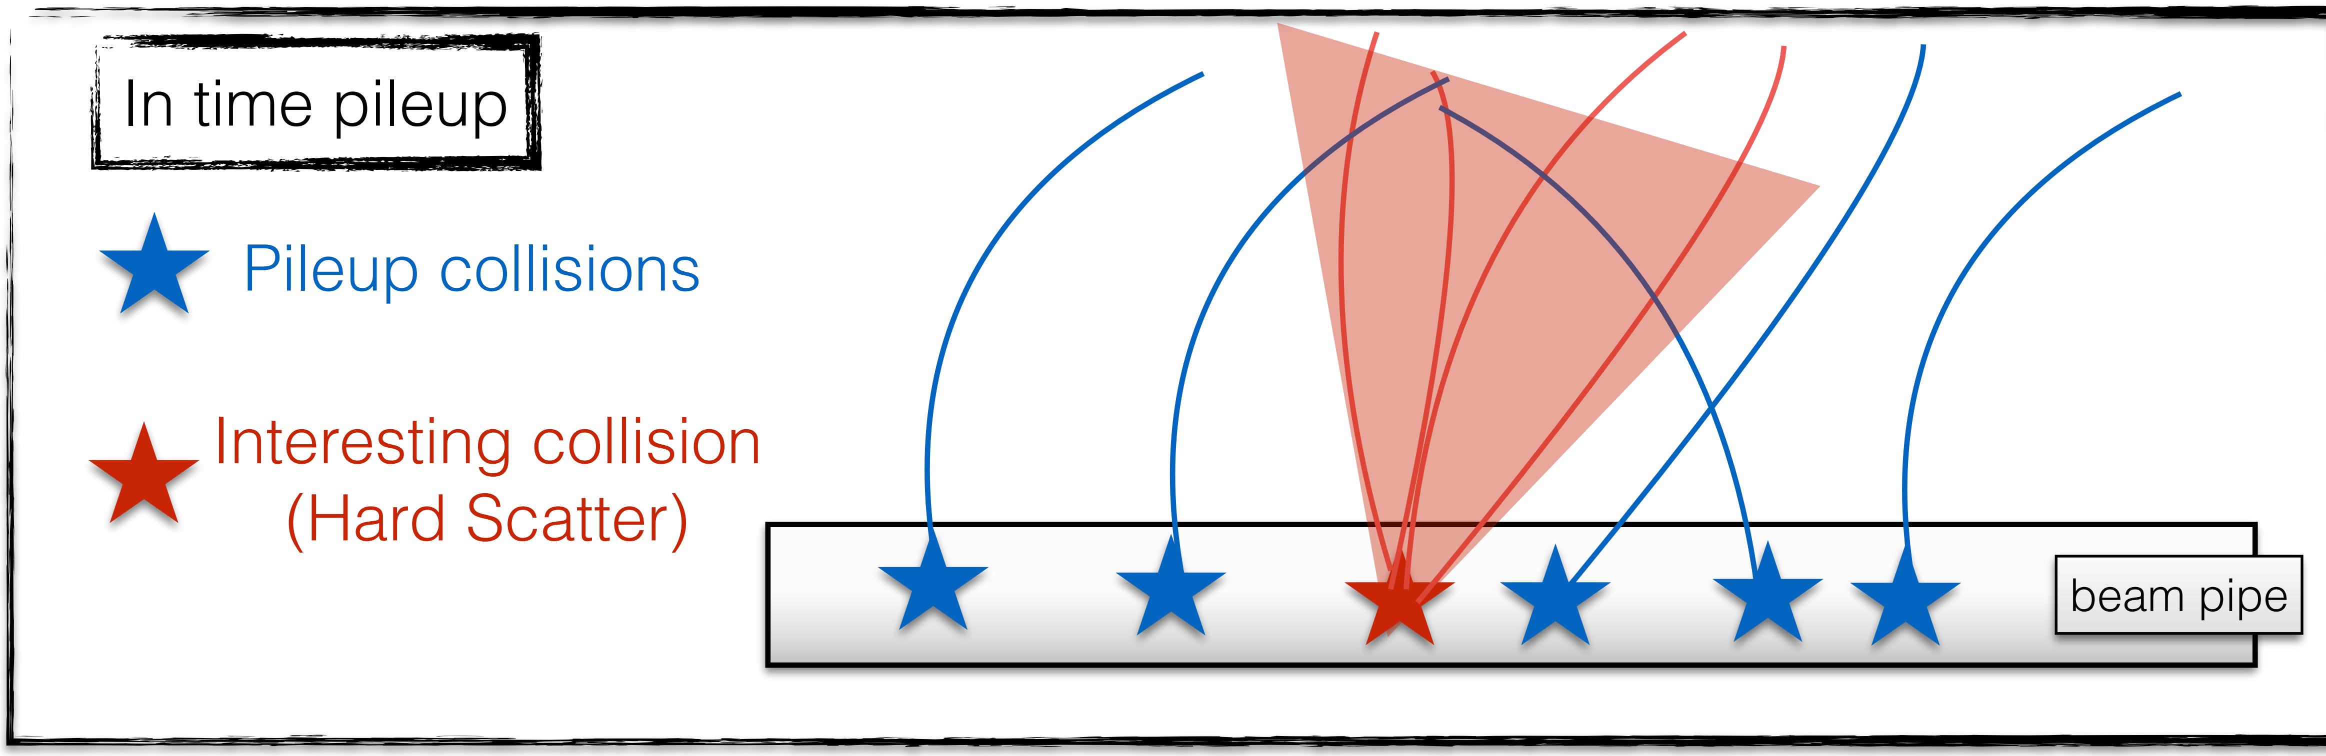


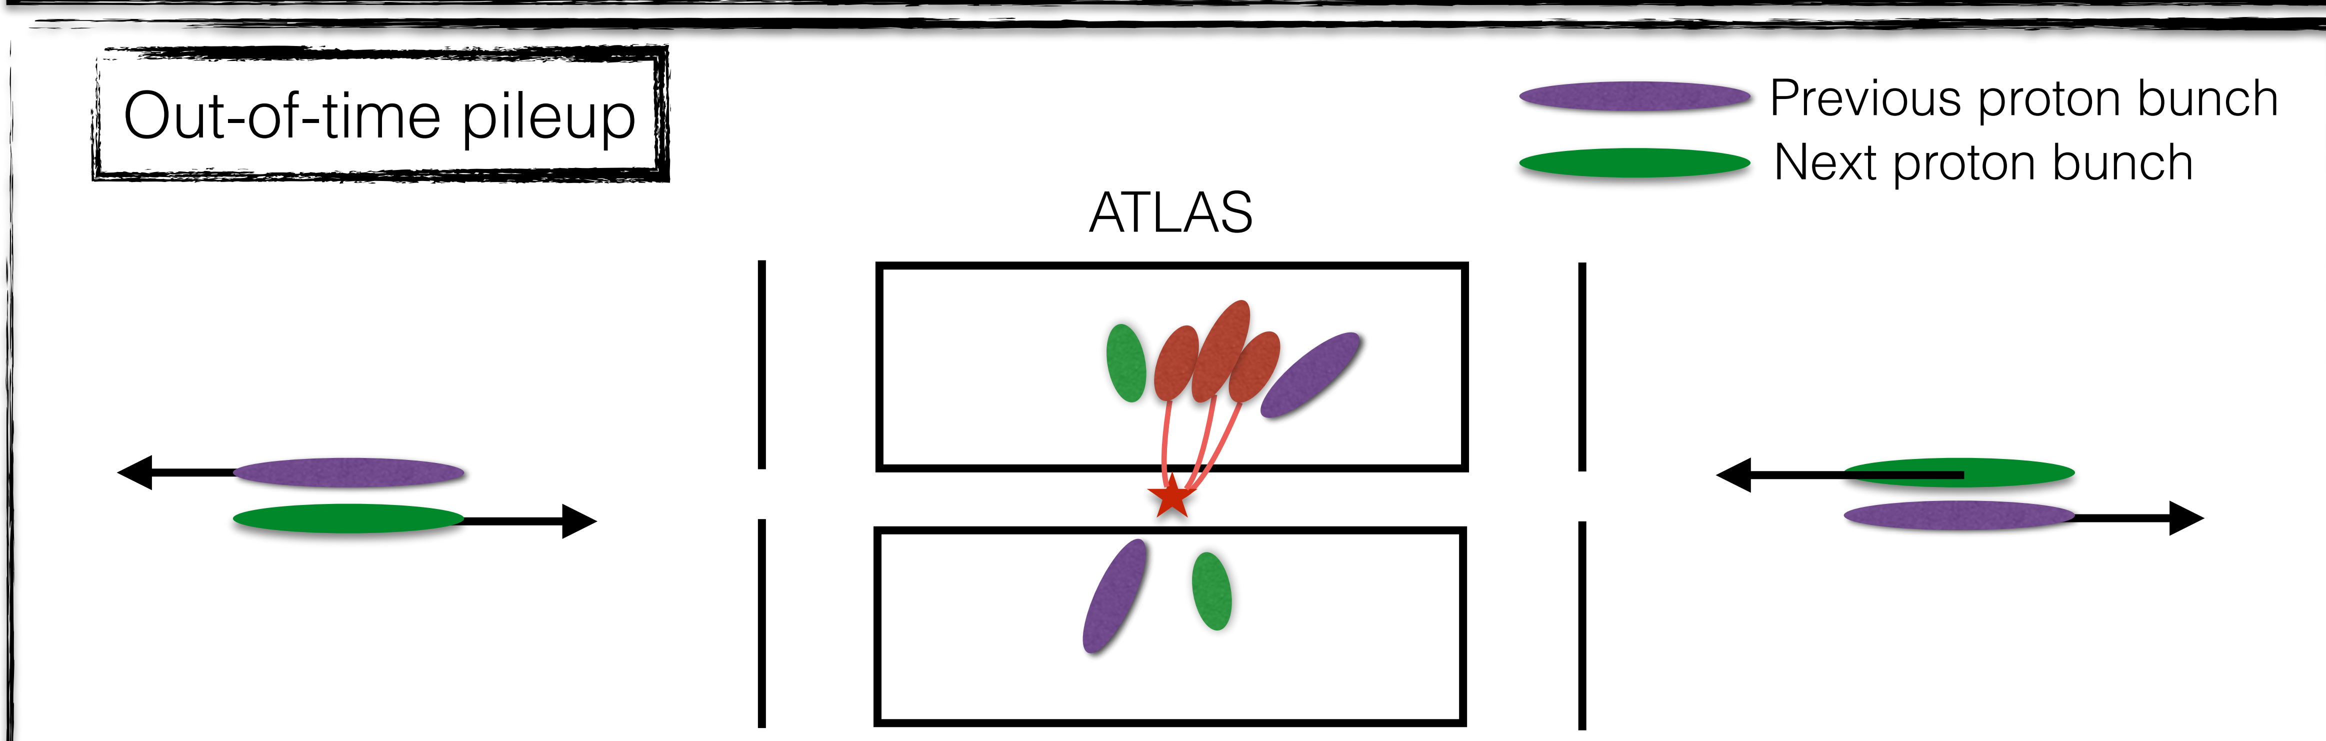
(a) Clustering of $|\epsilon^{\mathrm{EM}}_{\mathrm{cell}}| > 4$ cells. (b) Clustering of $|\epsilon^{\mathrm{EM}}_{\mathrm{cell}}| > 2$ cells. (c) Clustering of $|\epsilon^{\mathrm{EM}}_{\mathrm{cell}}| > 0$ cells.

The “issue” of pileup (1)

Pileup jets and identification

Pileup is necessary for increasing data rates at ATLAS.
However, this comes with a cost…

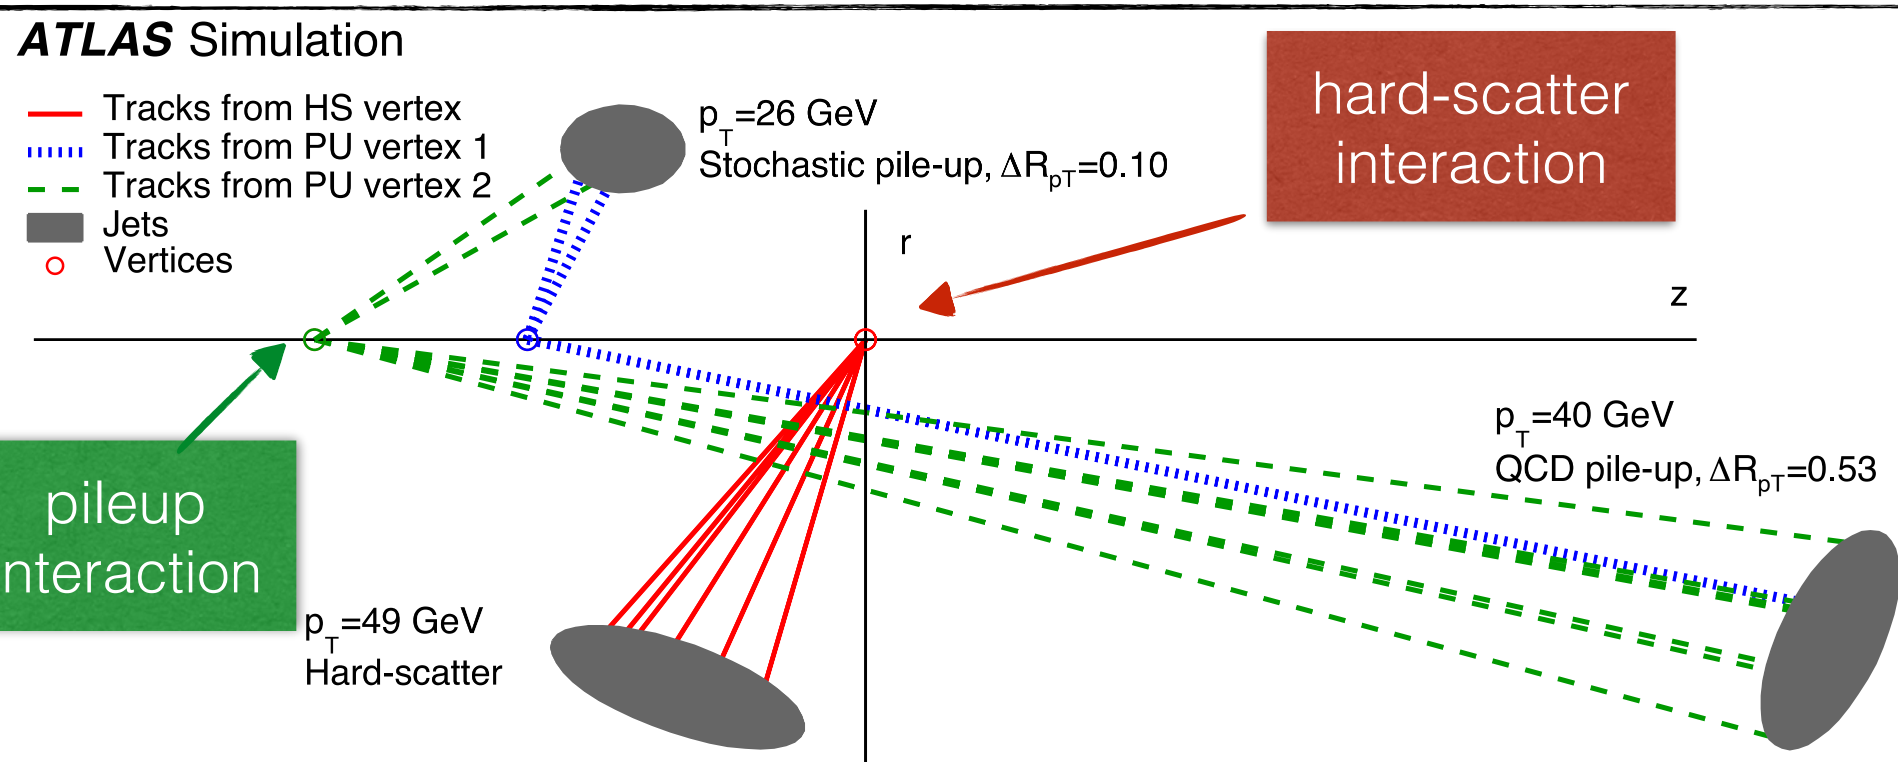




- 1
- 2
- 3

The “issue” of pileup (2)

Pileup jets and identification



Need to remove pileup jets for signal identification!

How can we suppress pileup jets?

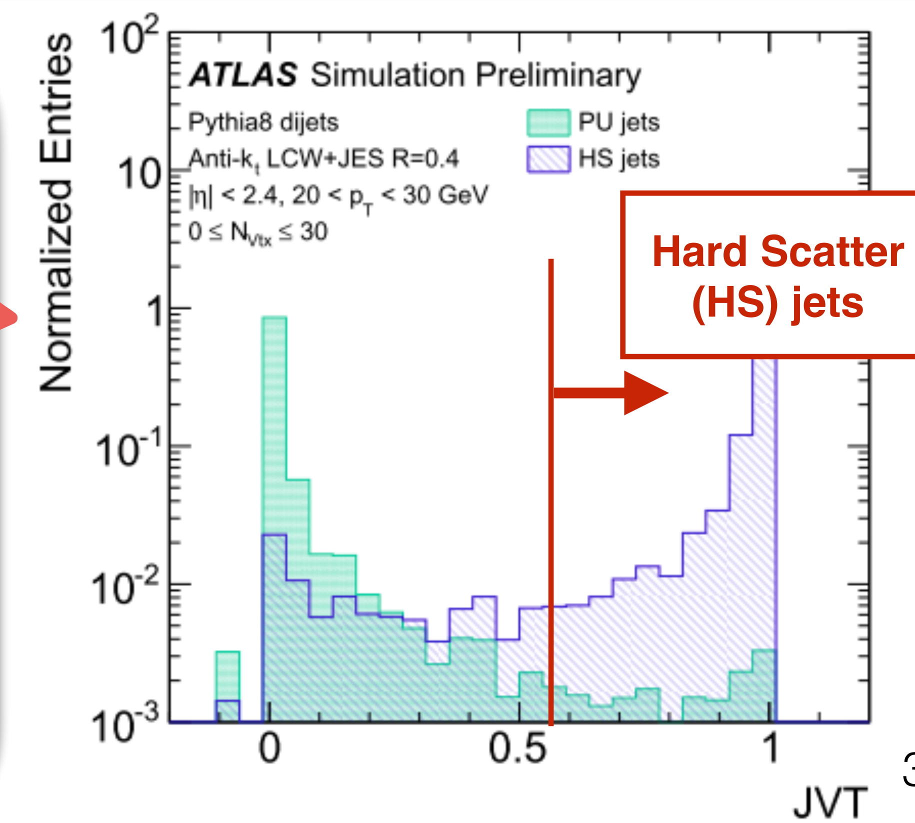
With tracking information used after jet building!

kNN

Two variables (based on tracking information):

$$R_{\mathrm{pT}} = \frac{\sum_k p_{\mathrm{T}}^{\mathrm{trk}_k}(\mathrm{PV}_0)}{p_{\mathrm{T}}^{jet}}$$

$$\mathrm{corrJVF} = \frac{\sum_k p_{\mathrm{T}}^{\mathrm{trk}_k}(\mathrm{PV}_0)}{\sum_l p_{\mathrm{T}}^{\mathrm{trk}_l}(\mathrm{PV}_0) + \frac{\sum_{n\geq 1}\sum_l p_{\mathrm{T}}^{\mathrm{trk}_l}(\mathrm{PV}_n)}{(k\cdot n_{\mathrm{trk}}^{\mathrm{PU}})}}$$



TST systematics uncertainties

TST systematic uncertainties

The systematics uncertainties specifically derived for MET are the **TST systematics**. Computed on three projected quantities:

- Parallel scale: average value of p_T^{soft} projection parallel to p_T^{hard}.
- Parallel resolution: RMS value of p_T^{soft} projection parallel to p_T^{hard}.
- Perpendicular resolution: RMS value of p_T^{soft} projection perpendicular to p_T^{hard}.

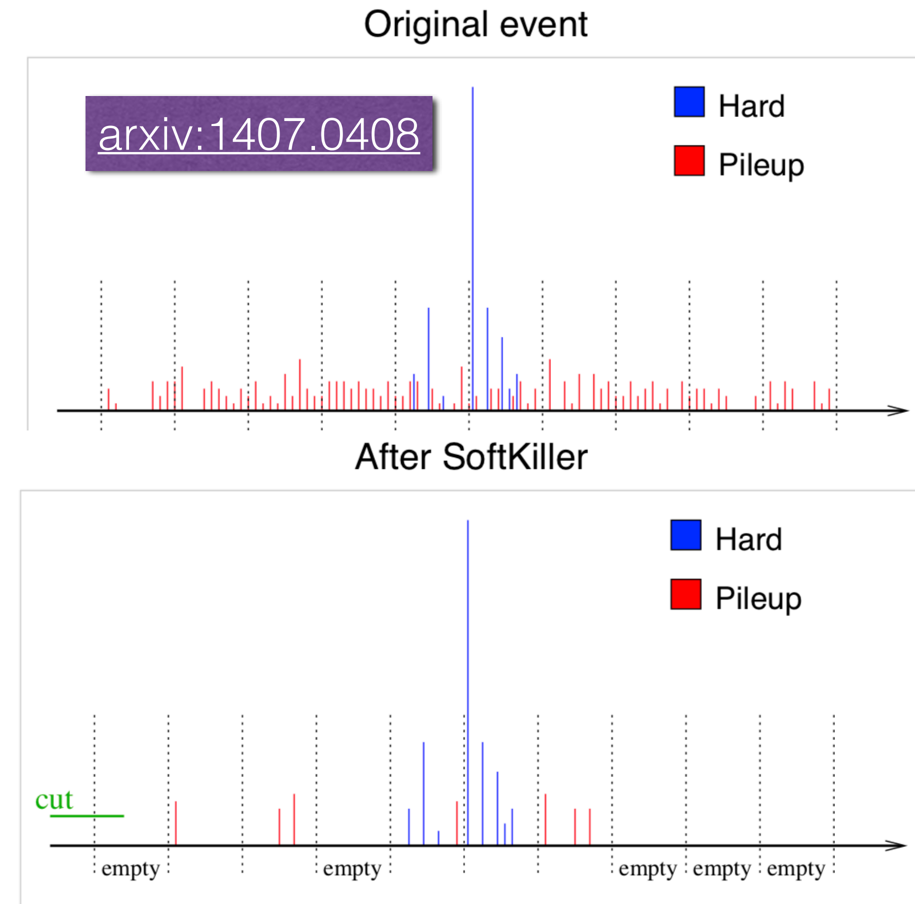
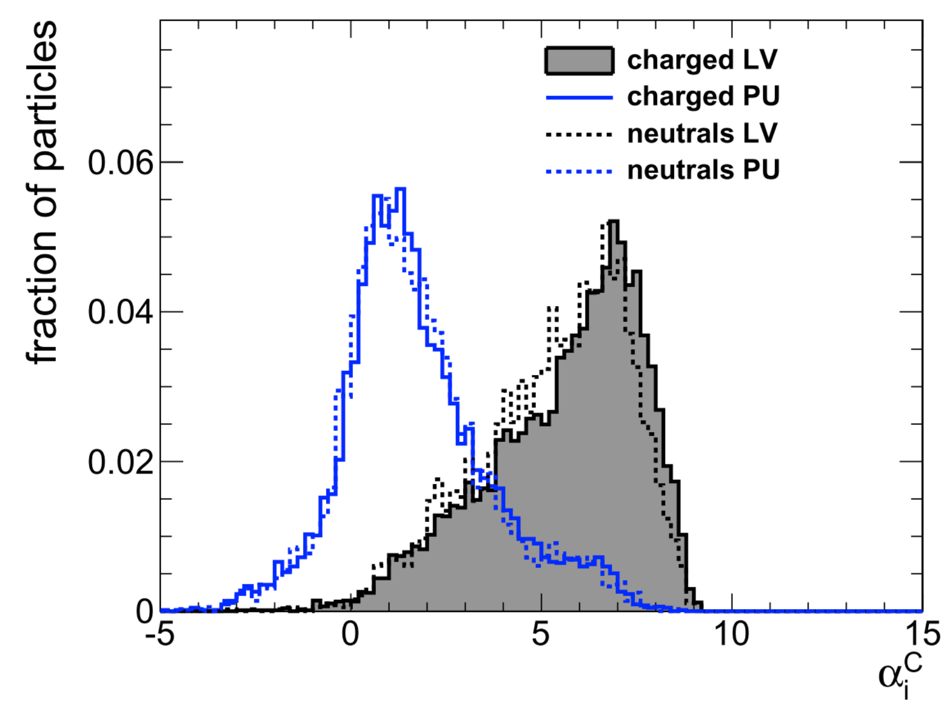
More on ML for neutral PU mitigation (1)

- On neutral PFOs, this is more difficult as no tracking information is available.
- Soft Killer (SK): divide η-φ plane into patches and choose the p_T cut implying 1/2 of filled patches by consituents.
- PUPPI: reject neutral pileup clusters using proximity with other high pT Charged hard-scatter clusters.

$$\alpha_i^C = \log \sum_{j\in \mathrm{Ch},} \frac{p_{Tj}}{\Delta R_{ij}^{\beta}} \Theta(R_{\min} \leq \Delta R_{ij} \leq R_0),$$

arxiv:1407.0408

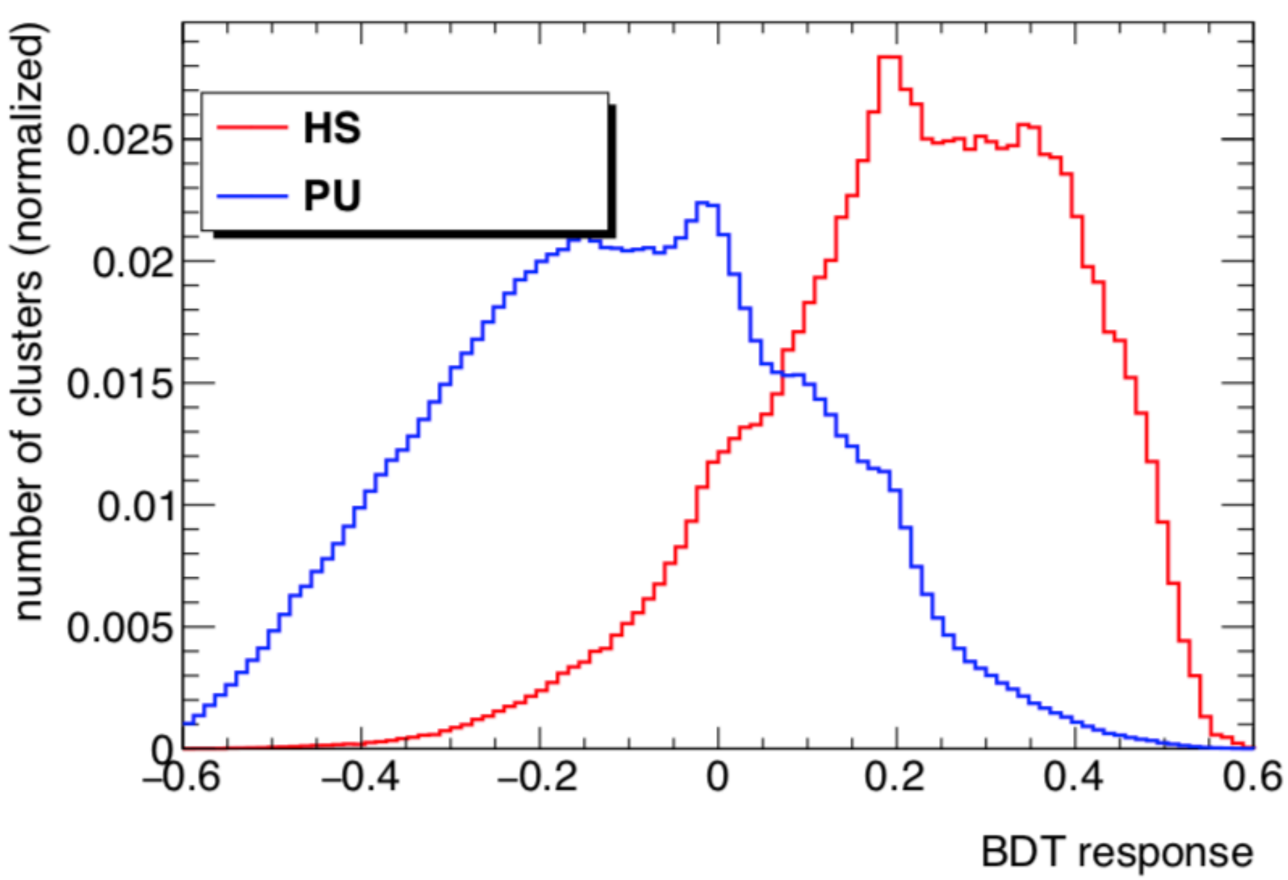


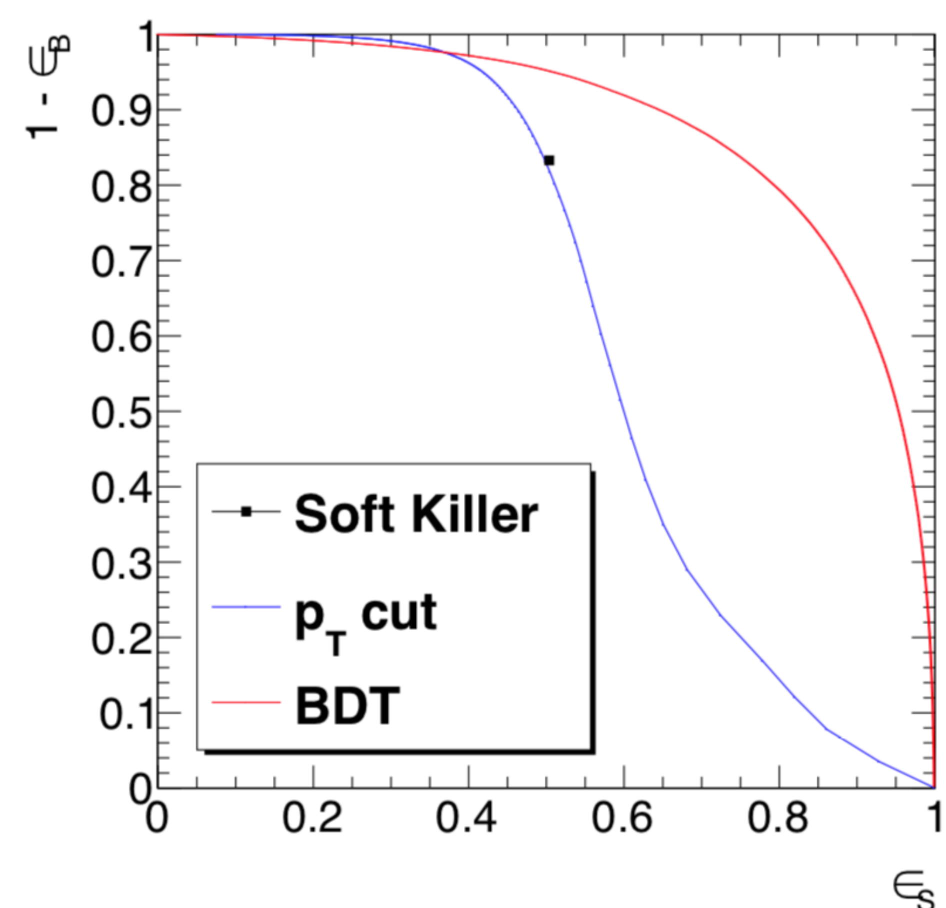


Particle Flow future prospects (3)

Neutral pileup suppression - Alternative approach with multivariate techniques

- Training performed using di-jet MC samples.
- BDT response offers good separation between Hard Scatter (HS) and Pileup (PU) neutral PFOs.
- BDT seems to offer better selection than p_T alone. Specially in the low p_T range.





- 1
- 2
- 3

More on ML for neutral PU mitigation (2)

- Possible to identify pileup neutral PFOs using:

$$\left| \frac{E - E_{\mathrm{DigiHSTruth}}}{E_{\mathrm{DigiHSTruth}}} \right| < 0.5$$

- Possibly **useful variables**:
  - Kinematic quantities: pT, η, ϕ
  - Topocluster timing (t)
  - PUPPI α
  - LAr and Tile signal quality
  - Topocluster shape information
  - And others…

Physics objects and variables (2)

MET significance: is the measured MET compatible with the 0 MET hypothesis?

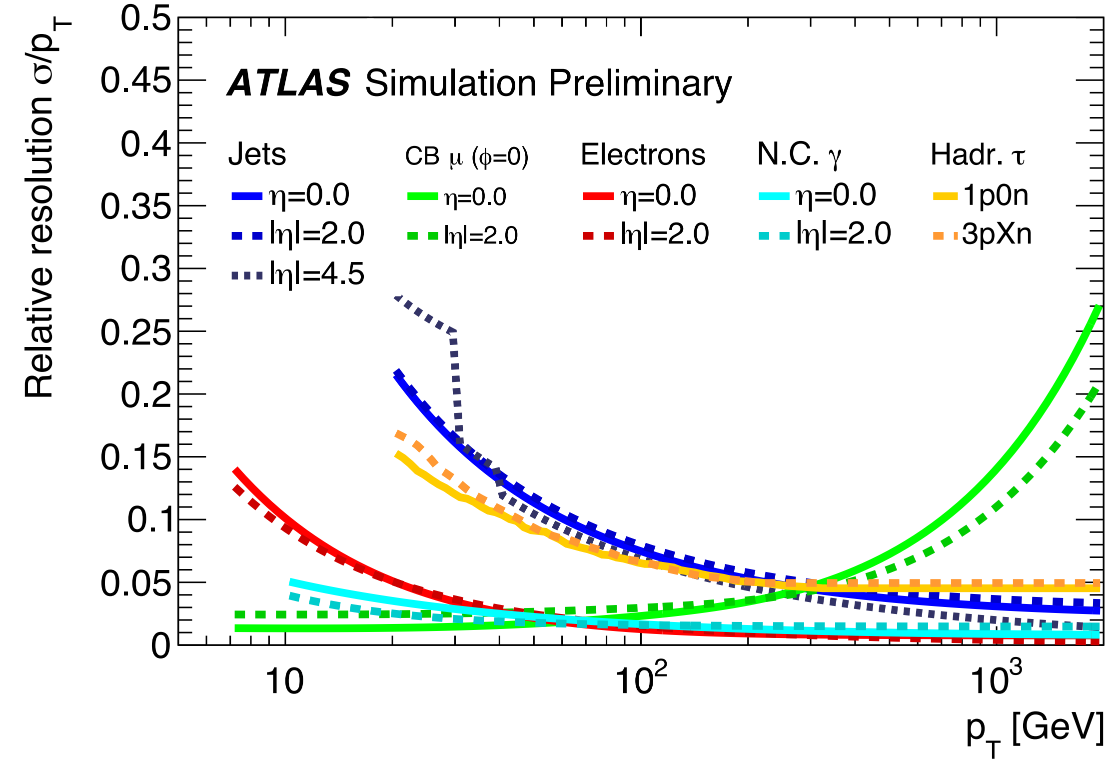
New

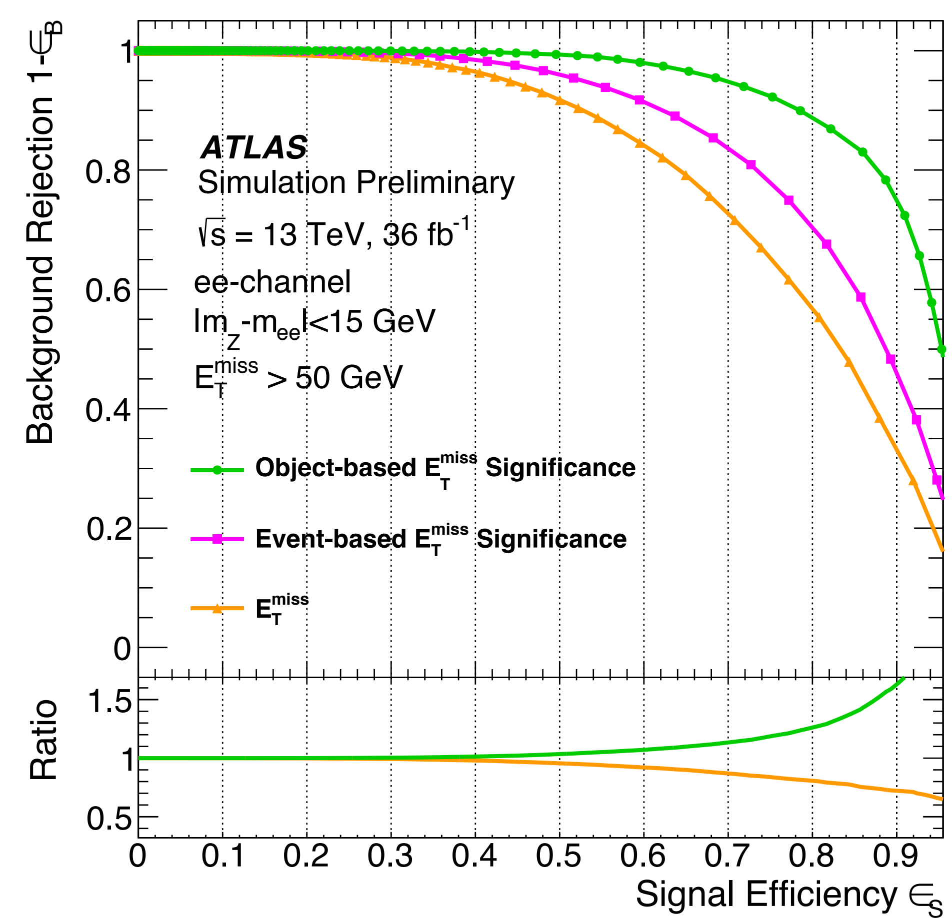
$$\mathcal{S} = \frac{E_T^{\text{miss}}}{\sigma(E_T^{\text{miss}})} \approx \frac{E_T^{\text{miss}}}{\sqrt{\sum p_{\mathrm{T}}}}$$

Old

In the objet-based approach, $\sigma(E_T^{\text{miss}})$ is estimated from the resolution of each physics object.

Object-based MET significance does a very nice job!



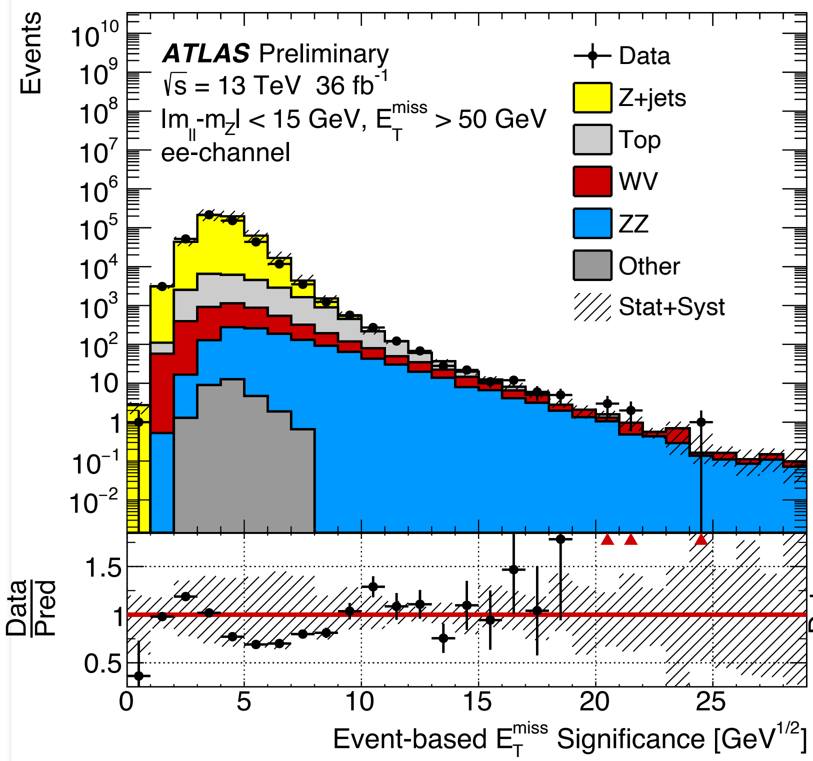


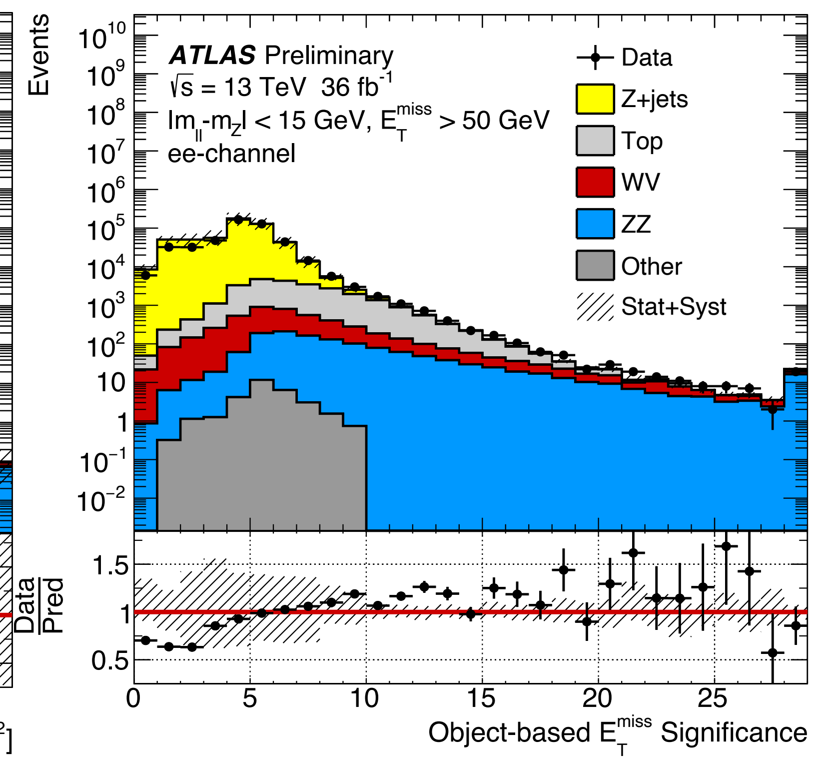
We can use MET significance above 5 four our Signal Regions.

Object-based MET significance

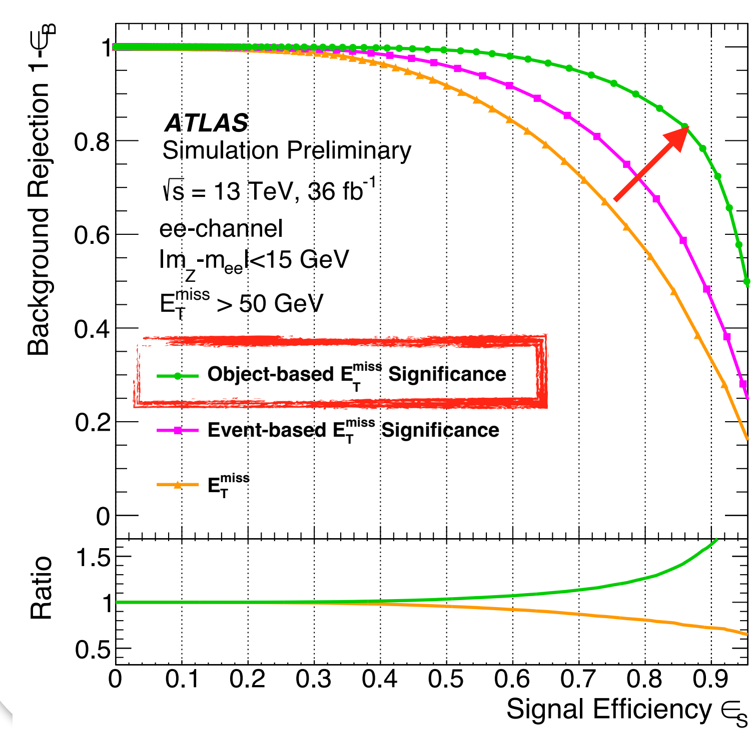
Object-based MET significance

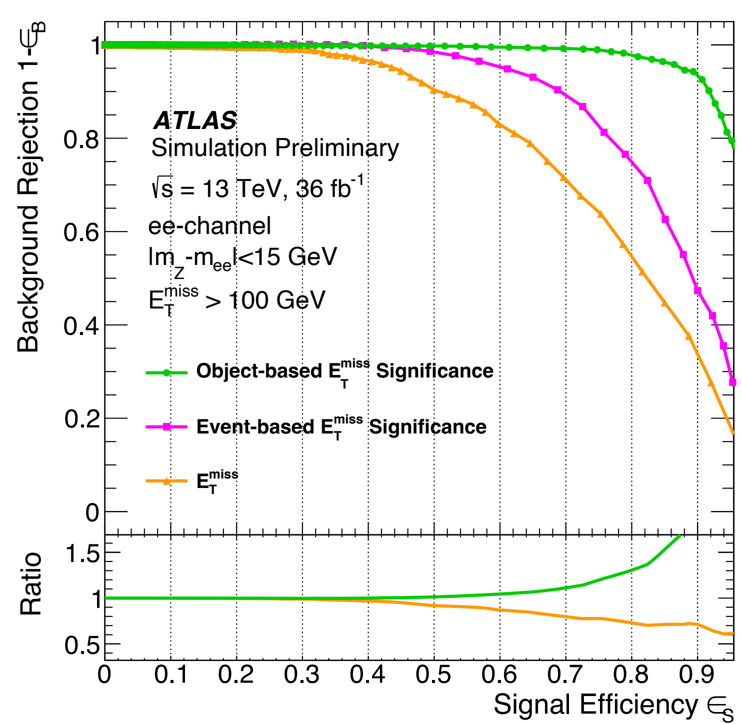
ATLAS object-based MET significance





Fake MET events ($Z \rightarrow ee$) has better separation from the ones with True MET.





ROC curves made using $Z \rightarrow ee$ and $Z \rightarrow ee\nu\nu$ as background and signal samples show clearly that **the object based MET significance provides better separation for events with true and fake MET**.

Multijets systematic uncertainties

- Background prediction needs an uncertainty before being compared to data.
- Considered systematics:
  - **Detector systematics:** accounting for the detector misconstruction effects (jet calibration uncertanties, b-tagging mismeasurement, etc.)
  - **Theory systematics:** accounting for wrong MC background modelling (ISR, FSR, etc.).
  - **Template systematics:** accounting for non closure, flavour and kinematic binning dependency.
- **Dominant systematics are generally the theoretical** (bad modelling of such an high jet multiplicity) **and template ones**.
- Jet systematics dominate the detector systematics due to the large number of jets O(10%).

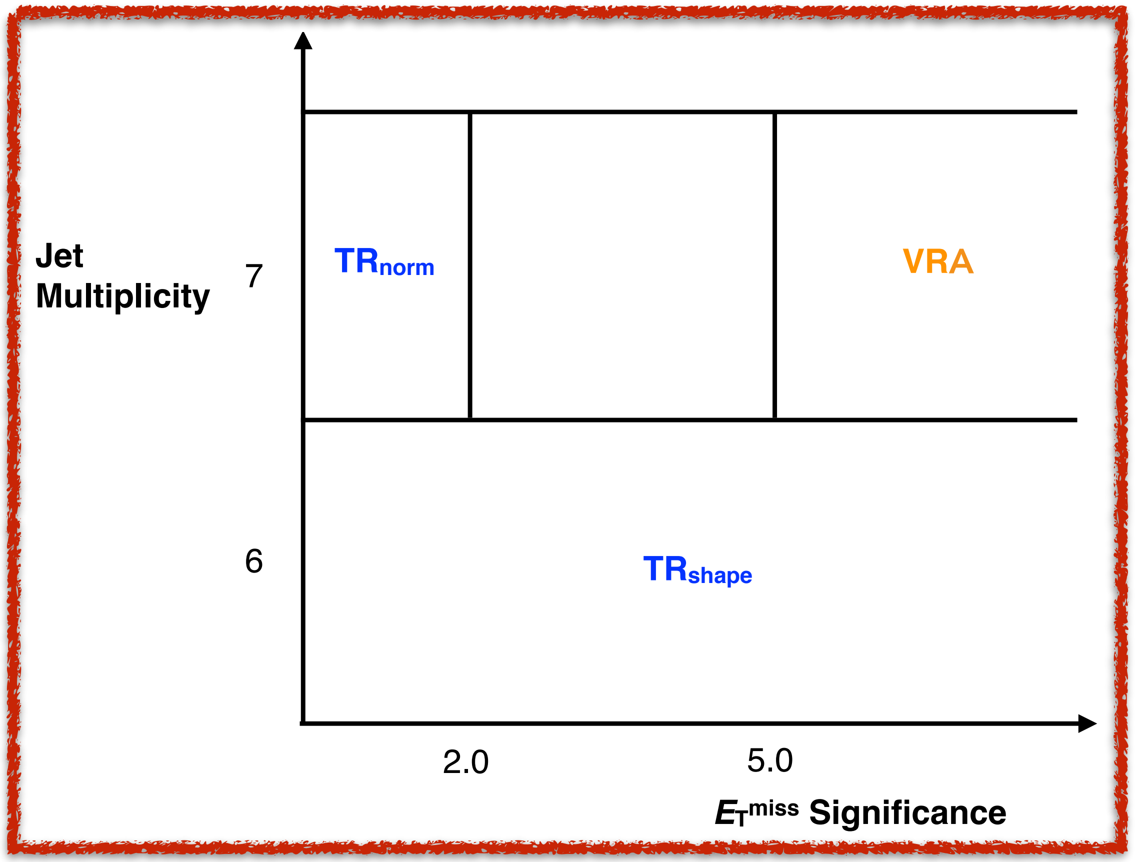
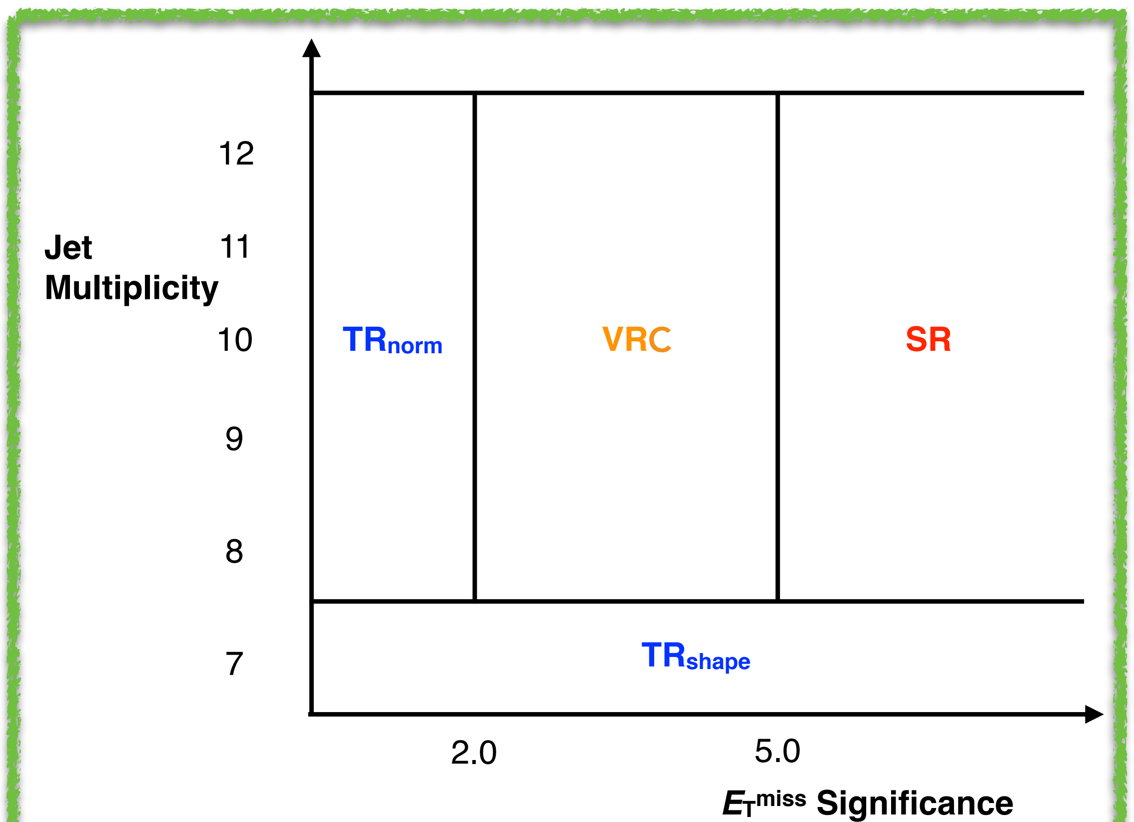
Analysis strategy (Signal regions)

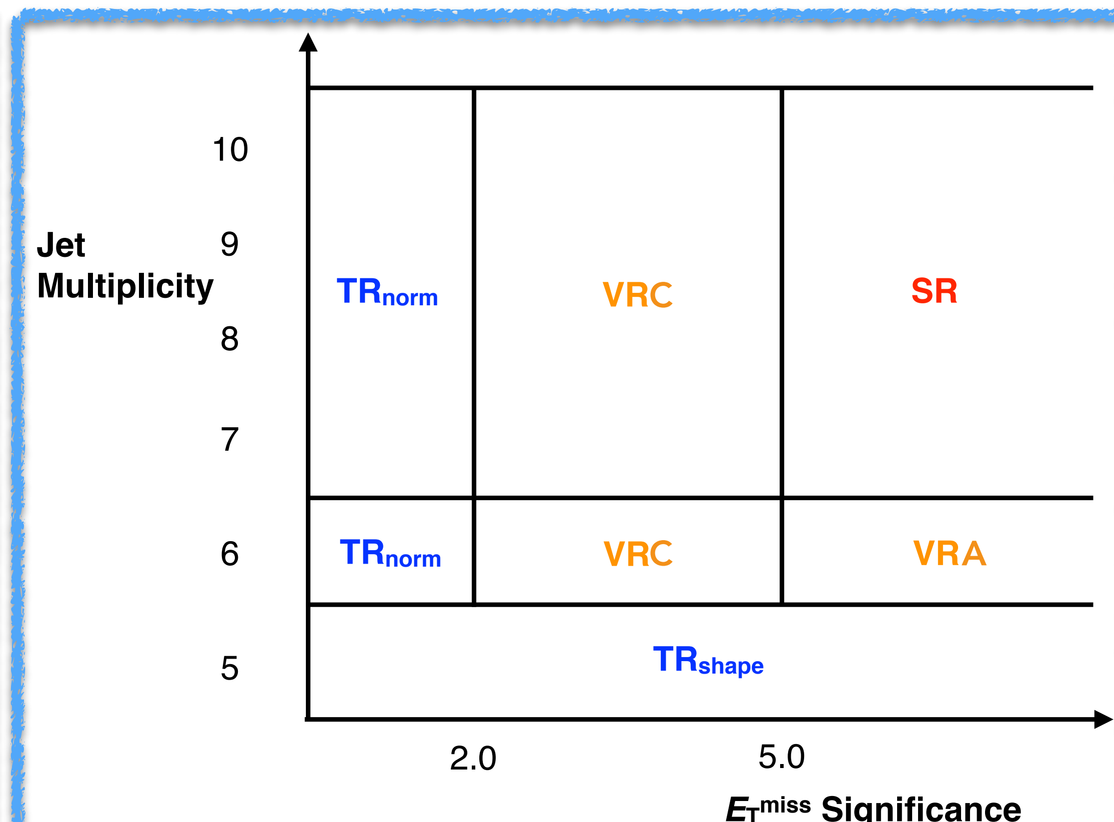
Validation Regions (VR)



Signal Regions (SR) $p_T > 50$ GeV



Signal Regions (SR) $p_T > 80$ GeV



More on RPV reinterpretations

- R-parity violation (RPV): decay of the LSP (DM candidate) to SM particles.
- **Only a few ATLAS analysis are specifically targeting RPV signatures**. RPV is hard to target considering:
  - **Displaced tracking** in high pileup conditions (both online and offline).
  - **Poor background discrimination** due to low MET signals.
- Due to the low cut on MET significance, the 0-lepton Multijets analysis is well suited for RPV reinterpretations.

Leptonic number violation

$$W_{\mathrm{RPV}} = \frac{\lambda_{ijk}}{2} L_i L_j \bar{E}_k + \lambda'_{ijk} L_i Q_j \bar{D}_k + \frac{\lambda''_{ijk}}{2} \bar{U}_i \bar{D}_j \bar{D}_k + \kappa_i L_i H_u,$$

Baryonic number violation
